EXECUTIVE SUMMARY

Groundwater sampling for the first quarter, 2000 included 83 locations. Of these, 14 wells were completely dry and a further 10 wells yielded only enough water to collect a partial analytical suite.

TIER I REPORTABLE RESULTS

There were two reportable analytical results above the Tier I Action Level in the first quarter of 2000. Plume Extent wells 22896 and 23296 had results indicating that trichloroethene was above the Tier I Action Level. Trichloroethene in well 22896 is within its normal range. In 23296 concentration has increased to the highest values recorded.

TIER II REPORTABLE RESULTS

Boundary Wells: Six Boundary wells were visited and sampled during the first quarter of 2000, none were dry. There was one reportable result for nickel in Boundary well 41591.

Boundary well 41591 had a reportable nickel result that was above the Tier II Action Level, the Background M2SD and its Historic M2SD. The current result continues the trend of increased nickel concentration documented in the third and fourth quarters of 1999.

Decontamination & Decommissioning Wells: Seven Decontamination and Decommissioning (D&D) wells were visited in the first quarter, 2000. None of these wells was dry. No reportable results were encountered in the D&D wells sampled. Five of the seven sampled D&D wells contained at least one analyte that exceeded Tier II Action Levels.

Decontamination and Decommissioning well 10498 had non-reportable results for methylene chloride, tetrachloroethene, uranium-233/234 and uranium-238. The tetrachloroethene was also above the Tier I Action Level.). The uranium-233/234 and uranium-238 results are well below the Background M2SD. The methylene chloride result in well 10498 while much higher than previously recorded is from an analysis that contained blank contamination. The tetrachloroethene result has also risen greatly since the previous sampling event. This report constitutes notification of the appropriate authorities of the high amounts of methylene chloride and tetrachloroethene in well 10498. Well 10498 will continue to be monitored on a semi-annual basis.

Decontamination and Decommissioning well 10598 had non-reportable quantities of barium and cadmium that were above the Tier II Action Levels and also above the Background M2SD. As with the VOCs discussed in well 10498 these two metals have increased greatly over previous sampling events. This report constitutes notification of the appropriate authorities of the high amounts of barium and cadmium in well 10598. Well 10598 will continue to be monitored on a semi-annual basis.

Drainage Wells: Four drainage wells were visited during the first quarter of 2000. None were dry. There was one reportable result for nickel in well 6486. Each well did have results greater than a Tier II Action Level.

Drainage well 6486 had a reportable occurrence of nickel. The concentration was above the Tier II Action Level and the Background M2SD. A series of monthly samples will be started immediately.

5

Performance Monitoring Wells: Seventeen Performance monitoring locations were visited in the first quarter, five of these were dry. Of the remaining 12 locations 11 had analytes with concentrations that exceeded Tier II Action Levels. There were no reportable results for Performance Monitoring locations in the first quarter.

Performance Monitoring well 07391 had non-reportable results for 1,1,1-trichloroethane, chloroform, methylene chloride, tetrachloroethene, trichloroethene, nitrate/nitrite, uranium-233/234, uranium-235 and uranium-238. The results for 1,1,1-trichloroethane, chloroform, nitrate/nitrite, uranium-233/234 and uranium-235 were above the Tier II Action Levels. The results for methylene chloride, tetrachloroethene, trichloroethene and uranium-238 were above the Tier I Action Levels. The 1,1,1-trichloroethane, chloroform, tetrachloroethene and trichloroethene values are within their normal ranges below their Historic M2SDs. The methylene chloride and nitrate/nitrite are above their Historic M2SDs. The uranium-233/234 is below the Background M2SD, while uranium-235 and uranium-238 are above their Background M2SDs. The methylene chloride values are the highest recorded but must be considered in light of blank contamination in the sample analysis. The nitrate/nitrite, uranium-235 and uranium-238 are also the highest recorded and are the continuation of trends established within the last two and a half years. Routine semi-annual monitoring will continue at well 07391.

Performance Monitoring well 10992 contained non-reportable quantities of selenium, nitrate/nitrite, uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. By inspection the selenium trend plot is within its normal range and is decreasing. Again by inspection the nitrate/nitrite trend plot appears to be within its normal range but is increasing. The uranium isotopes are below their respective Background M2SDs. Routine monitoring of well 10992 will continue.

Performance Monitoring well 15699 contained 1,1-dichloroethene, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 in amounts that were above their Tier II Action Levels and are not reportable. The tetrachloroethene and trichloroethene are also present in quantities high enough to be above their Tier I Action Levels. The uranium isotope results were below their Background M2SDs. By inspection the 1,1-dichloroethene, cis-1,2-dichloroethene and trichloroethene concentrations are part of decreasing trends within their normal ranges. The tetrachloroethene concentration by inspection is staying constant. Interpretation of the methylene chloride concentration is again complicated by blank contamination at the laboratory. It may be decreasing but all data points for methylene chloride are blank contaminated. Well 15699 will be maintained on a quarterly monitoring schedule

Performance Monitoring well 95199 had a non-reportable occurrence of trichloroethene that was above the Tier II Action Level. This is only the second set of results for this well. The previous trichloroethene result collected in October of 1999 was 38 μg/L suggesting that trichloroethene in the well may be increasing. Well 95199 will continue to be monitored on a quarterly basis.

Plume Definition Wells: Eight-Plume Definition wells were visited in the first quarter of 2000. None were dry. Seven of the eight sampled wells had at least one result that was above the Tier II Action Level. No results were above the Tier I Action Levels thus there were no reportable analytical results associated with Plume Definition wells.

Plume Definition well 6286 had non-reportable quantities of carbon tetrachloride, selenium, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The carbon tetrachloride was below its Historic M2SD. The selenium was above both the Background M2SD

6

and Historic M2SD for the well. In the recent past the selenium concentration has been at or above the Historic M2SD. The uranium-233/234 and uranium-238 results were below their Background M2SDs. A routine schedule of monitoring is being continued at well 6286.

Plume Degradation Wells: Twelve Plume Degradation wells were visited in the first quarter of 2000. Four wells were dry. No reportable occurrences were found. For eight compounds over five wells the Tier I Action Level was surpassed.

Plume Degradation well 18199 at IHSS 118.1 showed non-reportable concentrations of carbon tetrachloride, chloroform and methylene chloride that were above their Tier II Action Levels. The carbon tetrachloride and methylene chloride were also high enough to be above their Tier I Action Levels. The carbon tetrachloride and chloroform concentrations have increased over the past year of sampling. The methylene chloride sample shows a similar increase but was associated with blank contamination. Routine quarterly monitoring of this well is continuing.

Plume Degradation well 18299 contained concentrations of carbon tetrachloride, chloroform, methylene chloride and tetrachloroethene that were above their Tier II Action Levels but were not reportable. The carbon tetrachloride was also above its Tier I Action Level. The carbon tetrachloride and chloroform concentrations have increased since sampling began. The tetrachloroethene has also increased but not to the extent that carbon tetrachloride and chloroform have. The methylene chloride concentration may be increasing but the last two samples were associated with laboratory blank contamination. Semi-annual monitoring of 18299 is continuing.

Plume Degradation well 18499 held carbon tetrachloride, chloroform and methylene chloride in amounts that were above the Tier II Action Levels but were not reportable. The carbon tetrachloride and methylene chloride were also above their Tier I Action Levels. The carbon tetrachloride and chloroform have decreased over the three sampling events. The methylene chloride may be increasing but the last two sampling events have associated lab contamination. Well 18499 will continue on its routine of semi-annual sampling.

Plume Degradation well 18599 had carbon tetrachloride, chloroform and methylene chloride that were above the Tier II Action Levels but were not reportable. The carbon tetrachloride and methylene chloride were also above their Tier I Action Levels. The carbon tetrachloride and chloroform concentrations have increased since sampling began. The methylene chloride is again complicated by laboratory contamination in the last two sampling event but may be increasing. Routine semi-annual sampling of well 18599 will continue.

Plume Degradation well 90099 had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above their Tier II Action Levels. The trichloroethene was also above its Tier I Action Level. The carbon tetrachloride, tetrachloroethene and trichloroethene concentrations have declined. The methylene chloride may have increased but both results have associated laboratory contamination. Quarterly monitoring of 90099 will continue.

Plume Degradation well 90399 had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above their Tier II Action Levels. The carbon tetrachloride, tetrachloroethene and trichloroethene concentrations have increased. The methylene chloride may also have increased but both results have associated laboratory contamination. Quarterly monitoring of 90099 will continue.

7

Plume Extent Wells: Twenty-one Plume Extent wells were visited in the first quarter, three of these were dry. Of the 18 Plume Extent wells sampled 13 wells had analytes that exceeded Tier II Action Levels. From these 13 wells, two wells had a total of 10 reportable analytical results.

Plume Extent well 22896 contained reportable amounts of methylene chloride, tetrachloroethene, trichloroethene, nickel and nitrate/nitrite. The results for these analytes were above Tier II Action Levels. The tetrachloroethene and trichloroethene are within their normal ranges so no further action is anticipated. The methylene chloride result is high but is associated with laboratory contamination so again not further action is planned. The nickel result is also high but similar high results have occurred in the past and monthly sampling suites have already been completed for metals so no additional sampling is planned. Finally no additional sampling is planned for nitrate/nitrite because despite the limited number of samples the current result appears to be within its normal range. Routine sampling of well 22896 is being continued.

Plume Extent well 23296 contained reportable amounts of carbon tetrachloride, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene and trichloroethene. Non-reportable uranium-233/234 and uranium-238 were also present. Results for all these analytes were above Tier II Action Levels and trichloroethene was also above the Tier I Level. A February carbon tetrachloride result was the highest recorded so far while an April result declined significantly. The value for cis-1,2-dichloroethene decreased for three monthly samples from the maximum recorded in October 1999. The latest two cis-1,2-dichloroethene results are below the Tier II Action Level. All three methylene chloride results were above the Tier II Level. A March methylene chloride result was the highest recorded while an April result declined significantly. Methylene chloride sampling events have all been associated with contamination at the laboratory. The tetrachloroethene sample for February sample was the highest ever recorded. March and April samples were lower but still above the normal range for well 23296. The trichloroethene results were also high in February (highest ever) and March while the April result was within the normal range. Monthly sampling for these VOCs at well 23296 has concluded so only routine quarterly sampling of this well for VOCs will be required. The uranium-233/234 and uranium-238 results (only one sampling event) were below their Background M2SDs so no further action on their part is required.

RCRA Monitoring Wells: Eight RCRA monitoring wells were visited in the first quarter of 2000. Two wells were dry. Of the six sampled wells, one well exhibited two reportable results.

Upgradient RCRA Monitoring well 70193 had a non-reportable result for nitrate/nitrite. This result was considerably higher than the Tier II Action Level and is also considerably higher than previous samples collected at the well. No further action is required for upgradient RCRA wells so routine monitoring at 70193 will continue.

Downgradient RCRA Monitoring well B206989 had reportable lithium and selenium. It also had non-reportable results for nitrate/nitrite, uranium-233/234, uranium-235 and uranium-238. Results for all the analytes were above Tier II Action Levels. The current lithium and selenium results were reportable because they are part of increasing trends. The nitrate/nitrite results were above the Background M2SD but below the Historic M2SD for the well. The uranium-233/234, uranium-235 and uranium-238 concentrations are below the Background M2SDs. Well B206989 will be monitored routinely until the results from the monthly metals monitoring over the summer of 2000 can be evaluated in the Second Quarter Report.

8

Acronym List

ALF	Action Level Framework
Background M2SD	Background mean plus 2 standard deviations (calculated on a site wide basis)
CDPHE	Colorado Department of Public Health and Environment
CLP	Contract Laboratory Program
CRDL	Contract Required Detection Limit
D&D	Decontamination and Decommissioning
DER	Duplicate Error Ratio (calculated for real/duplicate radionuclide analyses)
DOE	United States Department of Energy
EPA	United States Environmental Protection Agency
Historic M2SD	Historic mean plus 2 standard deviations (calculated on a per well basis)
IHSS	Individual Hazardous Substance Site
IMP	Integrated Monitoring Plan
K-H	Kaiser-Hill, LLC
MCL	Maximum Contaminant Level
µg/l	microgram per liter
mg/l	milligram per liter
PARCC	Precision, Accuracy, Representativeness, Comparability and Completeness
PCB	Polychlorinated Biphenyl
pCi/l	picocurie per liter
PQL	Practical Quantitation Limit
QL	Quantitation Limit
RCRA	Resource Conservation and Recovery Act
RFCA	Rocky Flats Cleanup Agreement
RFETS	Rocky Flats Environmental Technology Site
RMRS	Rocky Mountain Remediation Services, LLC
RPD	Relative Percent Difference (calculated for non-radionuclide real/duplicate analyses)
SWD	Soil Water Database
TRPH	Total Recoverable Petroleum Hydrocarbon
TDS	Total Dissolved Solids
Tier I	Analyte specific action level originally defined by RFCA, updated by IMP
Tier II	10^{-2} of Tier I
TPU	Total Propagated Error
TSS	Total Suspended Solids
VOC	Volatile Organic Compound

9

1.0 INTRODUCTION

This report is required by Section 3.4.B of Attachment 5 of the Rocky Flats Cleanup Agreement (RFCA) (EPA, CDPHE, and DOE, 1996) and described in the Integrated Monitoring Plan (IMP) (DOE, 1999).

The DOE/K-H/RMRS team has completed evaluation of first quarter (January-February-March) 2000 groundwater analytical data using groundwater action level criteria as described in RFCA Attachment 5 (Kaiser-Hill, 2000). The sampling for the first quarter of 2000 reflects the approval of the monitoring well list (CDPHE, Nov. 1996 and EPA, Nov. 1996) and the establishment of semi-annual sampling frequencies. Therefore, only a portion of the RFCA monitoring wells are sampled and reported each quarter. The remainder will be sampled in the following quarter as site conditions allow. RFCA groundwater monitoring locations and five sump/drain locations (see below) are included in this report. The locations sampled during the first quarter, 2000 are listed in Table 3-1. The locations of the sampled sites are shown in Figure 1.

Results from newly installed well locations included in this report are Plume Degradation wells 90099, 90199, 90299 and 90399 associated with the Ryan's Pit Plume and Performance Monitoring wells 95099, 95199 and 95299 associated with the East Trenches Treatment System. Data gathered from these wells will be recorded in this series of Quarterly Groundwater Reports, as they become available.

Ryan's Pit Plume Plume Degradation Wells	East Trenches Treatment System Performance Monitoring Wells
90099	95099
90199	95199
90299	95299
90399	

In addition to monitoring wells cited in this report five other locations are included: 891COLGAL, 891COLWEL, SW13494, SW099 and SW100. The 891 locations are pump equipped wells that collect water from the French Drain on the Building 881 hillside. Location SW13494 is a sump for the footing drain system of the 881 Building; it also is located on the 881 hillside. SW099 and SW100 are outfalls for the groundwater collection system around the present sanitary landfill.

10

2.0 METHODS

The Groundwater Monitoring program attempted to collect and have analyzed 522 samples in the first quarter of 2000 under the Integrated Monitoring Plan (IMP) (DOE, 1999). Principally because of dry wells and wells with insufficient water only 415 requests for analysis were actually sent out. There were 63 uncollected samples related to dry wells and 36 related to insufficient water. Analyses for three sulfate and three fluoride samples were not performed due to a clerical error in labeling the collection bottle.

By the beginning of August 2000 approximately 100% (7763 records) of the first quarter 2000 data were available electronically from the Soil and Water Database (SWD). In general it was not necessary to manually compile data from the laboratory report packages except in the case of $Cesium_{137}$ (three records) and Dissolved Gasses (18 records). Results for all analyses that were sent out have been returned.

The analytical results were uploaded from SWD into a local MS Access database maintained by the groundwater group. Data were examined for presence/absence and consistency. Duplications and mismatches were excluded. Field and laboratory QC data were identified for use in the data quality assessment section (Sec. 7.0) using a Rocky Mountain Remediation Services (RMRS) Procedure: Evaluation of Data for Usability in Final Reports (RMRS, 1998).

Results for all detected analytes (results without a "U" qualifier) were compared with Tier I and Tier II Action Level Framework (ALF) criteria. Results exceeding Tier I or Tier II action levels were further compared with the site-wide Background Mean plus Two Standard Deviations (M2SD) value and well-specific Historic Mean plus Two Standard Deviations (M2SD) value. The three ratios calculated as a result of these comparisons are used to identify IMP reportable results as described below. Volatile Organic Compounds are assumed to have zero background concentration. The Historic M2SD is only calculated for wells with 5 or more sampling events collected during the years 1991 to 1995.

Table 3-2 represents a screen for any results that exceed the Tier II Action Levels. Table 3-2 is used to evaluate the reportable results via the Tier II, Background and Historic Ratios as described above and to help select analytes and wells which are of interest for site cleanup but which may not be reportable under IMP criteria.

Background values were taken from the Background Geochemical Characterization Report (DOE, 1993) with the exception of americium-241, plutonium-239/240, uranium-233/234, uranium-235, and uranium-238. Background values for these radionuclides were taken from the Draft Background Comparison for Radionuclides in Groundwater Report (DOE, 1997). Data were extracted directly from the SWD and/or the local groundwater database to calculate the historical M2SD for locations with analytes exceeding Tier II ALF criteria and to produce trend plots.

The groundwater monitoring network, as defined in the IMP (DOE, 1999), has eight categories of monitoring wells. The decision rule sequence presented in the IMP was followed for determining Tier I and II reportable results. The well types and decision rules are defined below:

Plume Definition Monitoring Wells: These wells are located within known contaminant plumes and are above Tier II action levels, but are below the Tier I action levels established in the ALF. A reportable result occurs when a measured concentration exceeds a Tier I action level and the

background value and the M2SD of the historical concentration in the well. The required action is to reclassify as a Tier I reportable result well and evaluate possible impacts to surface water.

Plume Extent Monitoring Wells: These wells are located at the edges of known groundwater contaminant plumes, along pathways to surface water. These wells monitor for an increase in concentrations that may result in future impacts to surface water. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no previous historical reportable results, or when a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

Drainage Monitoring Wells: These wells are located in stream drainages, downgradient of contaminant plumes. They have the same programmatic requirements as PE wells under the IMP. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no historical reportable results, or a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

Boundary Monitoring Wells: These wells monitor ground water leaving the eastern Site boundary through the stream drainage channels. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no historical reportable results, or a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

D&D Monitoring Wells: These wells monitor for releases to groundwater from decontamination and decommissioning (D&D) activities. A reportable result occurs when a measured concentration exceeds the M2SD of the established historical baseline concentration downgradient of the building(s). The required action is to inform appropriate parties and initiate an evaluation of the situation.

Performance Monitoring Wells: These wells monitor the effect of a remediation or source removal action, as required in the ALF. If an increasing trend in the concentration of a contaminant is noted, then the appropriate parties are notified and an evaluation of the situation is initiated.

RCRA Monitoring Wells: These wells monitor downgradient groundwater contaminant concentrations at RCRA units. If the mean concentration of a contaminant in a downgradient well exceeds the mean concentration in upgradient wells and concentrations at the well show an upward trend with time, a report will be made to appropriate agencies and an investigation will be initiated to determine possible causes. This evaluation will be performed in the annual RFETS RFCA Groundwater Monitoring Report.

For the purposes of the quarterly reports, analytical results from downgradient RCRA wells will be treated in the same manner as Plume Extent wells. A reportable result for a RCRA well occurs if a

12

measured concentration exceeds a Tier II action level and the background value. When there are no historical reportable results, or a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated. As noted above a review of the relative concentrations of upgradient and downgradient wells will be performed in an annual report.

Plume Degradation Monitoring Wells: These wells are located either in downgradient areas that may be contaminated from a specific source or in associated upgradient areas. Data will be reviewed annually to determine if sufficient data have been collected to support remedial decision making. Upon collection of sufficient data an evaluation will be performed to establish inputs to the remedial conceptual model.

3.0 RESULTS

Groundwater sampling for the first quarter, 2000 included 83 locations. Of these, 14 wells were completely dry and a further 10 wells yielded only enough water to collect a partial analytical suite. Table 3-1 summarizes data collection activities for the first quarter of 2000. All sample results for the first quarter have been received as of this writing.

Major findings are presented in Table 3-2 and are summarized in the following discussion. Figure 1 illustrates the location of major plume boundaries relative to monitoring locations. Locations found to have reportable results of Tier I or II, action-level criteria are noted. Historic trends are shown for selected wells with analyte concentrations above Tier I or Tier II Action Levels (Figures 2-1 to 2-75). Other illustrated trends include organic compounds with concentrations exceeding Tier II action levels, and for any inorganic analytes with concentrations exceeding Tier II action levels and background M2SD. The RFCA (EPA, CDPHE, DOE, 1996) requires that this information be reported quarterly.

3.1 TIER I REPORTABLE RESULTS

There were two reportable analytical results above the Tier I Action Level in the first quarter of 2000 (Table 3-2). Plume Extent wells 22896 and 23296 had results indicating that trichloroethene was above the Tier I Action Level. Because a series of monthly samples was being collected there are actually two records for well 23296 that show trichloroethene exceeded the Tier I Level, only the higher value is included in Table 3-2. A trend plot for trichloroethene in well 22896 shows that the concentration is within its normal range (Figure 2-50). The trichloroethene trend plot for well 23296 indicates that concentration has increased to the highest values recorded (Figure 2-51).

3.2 TIER II REPORTABLE RESULTS

Boundary Wells: Six Boundary wells were visited and sampled during the first quarter of 2000, none were dry. There was one reportable result for nickel in Boundary well 41591.

Boundary wells 0386, 06491, 10294, 10394 and 41591 had non-reportable amounts of uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. These quantities were below the Background M2SD and are therefore not reportable. Wells 0386, 06491, 10294 and 10394 will continue to be monitored in a routine manner. See below for further discussion of well 41591.

Boundary well 41591 had a reportable nickel result that was above the Tier II Action Level, the Background M2SD and its Historic M2SD (Table 3-2 and Figure 2-61). The current result continues the trend of increased nickel concentration documented in the third and fourth quarters of 1999. Monthly sampling has been completed and discussed in the third and fourth quarter 1999 reports so well 41591 will remain on a routine schedule of sampling.

Decontamination & Decommissioning Wells: Seven Decontamination and Decommissioning (D&D) wells were visited in the first quarter, 2000. None of these wells was dry. No reportable results were encountered in the D&D wells sampled. Five of the seven sampled D&D wells contained at least one analyte that exceeded Tier II Action Levels.

14

Decontamination and Decommissioning wells 10098 and 22996 had non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Levels but well below the Background M2SDs. These two wells will continue on their routine schedule of monitoring.

Decontamination and Decommissioning well 10498 had non-reportable results for methylene chloride, tetrachloroethene, uranium-233/234 and uranium-238. The tetrachloroethene was also above the Tier I Action Level. The uranium-233/234 and uranium-238 results are well below the Background M2SD. The methylene chloride result in well 10498 while much higher than previously recorded is from an analysis that contained blank contamination (Figure 2-23). The tetrachloroethene result has also risen greatly since the previous sampling event (Figure 2-35). Due to the accelerated plan for the removal of Building 123 a baseline for either methylene chloride or tetrachloroethene has not been established. Comparing the current downgradient-10498 results with upgradient wells 10098 and 10198 indicates that for both compounds 10498 results are well above any previous sampling event in either 10098 or 10198. (Results for methylene chloride and tetrachloroethene in 10098 and 10198 are equal to 1 μg/L, "U" non-detections.) This report constitutes notification of the appropriate authorities of the high amounts of methylene chloride and tetrachloroethene in well 10498. Well 10498 will continue to be monitored on a semi-annual basis.

Decontamination and Decommissioning well 10598 had non-reportable quantities of barium and cadmium that were above the Tier II Action Levels and also above the Background M2SD. As with the VOCs discussed in well 10498 these two metals have increased greatly over previous sampling events (Figures 2-55 and 2-56). Again, because of the accelerated removal of Building 123 no baselines for barium or cadmium are available. Comparing downgradient well 10598 to upgradient wells 10098 and 10199 shows that the current 10598 results for barium and cadmium are well above those from the other two wells. This report constitutes notification of the appropriate authorities of the high amounts of barium and cadmium in well 10598. Well 10598 will continue to be monitored on a semi-annual basis.

Drainage Wells: Four drainage wells were visited during the first quarter of 2000. None were dry. There was one reportable result for nickel in well 6486. Each well did have at least one result greater than a Tier II Action Level.

Drainage wells 00997, 38591, 6486 and 6586 had non-reportable amounts of uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. These quantities were below the Background M2SD and are therefore not reportable. Wells 00997, 38591 and 6586 will continue to be monitored in a routine manner. See below for further discussion of well 6486.

Drainage well 6486 also had a reportable occurrence of nickel. The concentration was above the Tier II Action Level and the Background M2SD (there are not enough data points during 1991 to 1995 to calculate a Historic M2SD, Figure 2-59). A series of monthly samples at well 6486 has not been collected so a set will be started immediately. This will satisfy the decision rule IMP requirements. Note that well 6486 has had limited amounts of water in the recent past and may not provide enough water for the three month suite.

Performance Monitoring Wells: Seventeen Performance monitoring locations were visited in the first quarter, five of these (wells) were dry. Of the remaining 12 locations 11 had analytes with concentrations that exceeded Tier II Action Levels. There were no reportable results for Performance Monitoring locations in the first quarter.

15

Performance Monitoring locations 00797, 10692 and 891COLGAL had non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Levels. These results were all below their Background M2SDs and therefore monitoring of the wells will continue in a routine manner.

Performance Monitoring well 05691 exhibited non-reportable results for carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238. The uranium isotope results were well below the Background M2SD. The carbon tetrachloride (Figure 2-9), tetrachloroethene (Figure 2-33) and trichloroethene (Figure 2-46) were within their normal ranges below their Historic M2SDs. Methylene chloride was well above its Historic M2SD but the sample analysis is associated with blank contamination at the laboratory (Figure 2-21). Well 05691 will continue on its semi-annual schedule of sampling.

Performance Monitoring well 07391 had non-reportable results for 1,1,1-trichloroethane, chloroform, methylene chloride, tetrachloroethene, trichloroethene, nitrate/nitrite, uranium-233/234, uranium-235 and uranium-238. The results for 1,1,1-trichloroethane, chloroform, nitrate/nitrite, uranium-233/234 and uranium-235 were above the Tier II Action Levels. The results for methylene chloride, tetrachloroethene, trichloroethene and uranium-238 were above the Tier I Action Levels. The 1,1,1-trichloroethane (Figure 2-1), chloroform (Figure 2-15), tetrachloroethene (Figure 2-34) and trichloroethene (Figure 2-47) values are within their normal ranges below their Historic M2SDs. The methylene chloride (Figure 2-22) and nitrate/nitrite (Figure 2-69) are above their Historic M2SDs. The uranium-233/234 is below the Background M2SD, while uranium-235 (Figure 2-74) and uranium-238 (Figure 2-75) are above their Background M2SDs. The methylene chloride values are the highest recorded but must be considered in light of blank contamination in the sample analysis. The nitrate/nitrite, uranium-235 and uranium-238 are also the highest recorded and are the continuation of trends established within the last two and a half years. Routine semi-annual monitoring will continue at well 07391.

Performance Monitoring well 10992 contained non-reportable quantities of selenium, nitrate/nitrite, uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. By inspection the selenium trend plot is within its normal range and is decreasing (Figure 2-64). Again by inspection the nitrate/nitrite trend plot appears to be within its normal range but is increasing (Figure 2-70). The uranium isotopes are below their respective Background M2SDs. Routine monitoring of well 10992 will continue.

Performance Monitoring well 12691 had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The uranium-233/234 and uranium-238 were both below their Background M2SDs. The carbon tetrachloride (Figure 2-10), tetrachloroethene (Figure 2-66) and trichloroethene (Figure 2-48) were below their Historic M2SDs and within their normal ranges. The methylene chloride (Figure 2-24) result while the highest recorded and part of an apparent increasing trend is made less reliable because of blank contamination. Well 12691 remains on its semi-annual sampling schedule.

Performance Monitoring well 15699 contained 1,1-dichloroethene, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 in amounts that were above their Tier II Action Levels and that are not reportable. The tetrachloroethene and trichloroethene are also present in quantities high enough to be above their Tier I Action Levels. The uranium isotope results were below their Background M2SDs. By inspection the

16

1,1-dichloroethene (Figure 2-2), cis-1,2-dichloroethene (Figure 2-17) and trichloroethene (Figure 2-49) concentrations are part of decreasing trends within their normal ranges. The tetrachloroethene concentration by inspection is staying constant (Figure 2-37). Interpretation of the methylene chloride concentration is again complicated by blank contamination at the laboratory (Figure 2-25). It may be decreasing but note that all data points for methylene chloride are blank contaminated. Well 15699 will be maintained on a quarterly monitoring schedule

Performance Monitoring location 891COLWEL had non-reportable carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, selenium, uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. The uranium-233/234 and uranium-238 were below the Background M2SDs. The carbon tetrachloride (Figure 2-14), methylene chloride (Figure 2-29), tetrachloroethene (Figure 2-41), trichloroethene (Figure 2-53) and selenium (Figure 2-66) were within their normal ranges and below their Historic M2SDs. Note that the methylene chloride result is again associated with blank contamination. Routine quarterly monitoring of location 891COLWEL will continue.

Performance Monitoring well 95199 had a non-reportable occurrence of trichloroethene (53 µg/L) that was above the Tier II Action Level. This is only the second set of results for this well. The previous trichloroethene result collected in October of 1999 was 38 µg/L suggesting that trichloroethene in the well may be increasing. Well 95199 will continue to be monitored on a quarterly basis.

Performance Monitoring location SW13494 results for tetrachloroethene, uranium-233/234 and uranium-238 that were not reportable yet above the Tier II Action Levels. The tetrachloroethene concentration is within its normal range and below the Historic M2SD for the well (Figure 2-42). In the past three years the tetrachloroethene concentration has oscillated above and below its Historic M2SD. The uranium isotope concentrations were both well below their Background M2SDs.

Plume Definition Wells: Eight-Plume Definition wells were visited in the first quarter of 2000. None were dry. Seven of the eight sampled wells had at least one result that was above the Tier II Action Level. No results were above the Tier I Action Levels thus there were no reportable analytical results associated with Plume Definition wells.

Plume Definition well 00491 contained non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The carbon tetrachloride (Figure 2-5), methylene chloride (Figure 2-19), tetrachloroethene (Figure 2-30) and trichloroethene (Figure 2-43) were within their normal ranges, below their Historic M2SDs. The methylene chloride result is associated with blank contamination at the laboratory. The uranium isotopes were both below the Background M2SDs. Routine semi-annual monitoring of well 00491 will continue.

Plume Definition well 00597 had non-reportable concentrations of trichloroethene and nitrate/nitrite that were above their Tier II Action Levels. By inspection the trichloroethene concentration is equal to the Tier II Action Level and has not changed significantly since the inception of sampling (Figure 2-45). By inspection the nitrate/nitrite concentration is high for the well but has declined slightly from the last sampling event (Figure 2-68). The nitrate/nitrite trend plot suggests that the nitrate/nitrite concentration has not changed since sampling began. Well 00597 will continue to be monitored on a routine basis.

17

Plume Definition well 03991 exhibited quantities of carbon tetrachloride, uranium-233/234 and uranium-238 that were not reportable but above their Tier II Action Levels. The carbon tetrachloride is within its normal range and below its Historic M2SD (Figure 2-6). The uranium isotopes were both below their Background M2SDs. Routine monitoring of well 03991 is continuing.

Plume Definition well 0487 contained non-reportable carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, selenium, uranium-233/234 and uranium-238. The uranium-233/234 and uranium-238 were below their Background M2SDs. The carbon tetrachloride (Figure 2-7), methylene chloride (Figure 2-20), tetrachloroethene (Figure 2-31), trichloroethene (Figure 2-44) and selenium (Figure 2-62) concentrations are all below their Historic M2SDs and therefore within their normal ranges. The methylene chloride result is associated with blank contamination at the lab as some of the methylene chloride results have been in the past. Routine monitoring of 0487 will be continued.

Plume Definition well 05391 contained carbon tetrachloride, tetrachloroethene and uranium-233/234 that were above Tier II Action Levels but are not reportable. The carbon tetrachloride (Figure 2-8) and tetrachloroethene (Figure 2-32) were below their Historic M2SDs and the uranium was below the Background M2SD. Routine monitoring of 05391 will be maintained.

Plume Definition well 6286 had non-reportable quantities of carbon tetrachloride, selenium, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The carbon tetrachloride was below its Historic M2SD (Figure 2-13). The selenium was above both the Background M2SD and Historic M2SD for the well (Figure 2-63). In the recent past the selenium concentration has been at or above the Historic M2SD. The uranium-233/234 and uranium-238 results were below their Background M2SDs. A routine schedule of monitoring is being continued at well 6286.

Plume Definition well P209389 exhibited concentrations of 1,1-dichloroethene and uranium-238 which while not reportable were above their Tier II Action Levels. The 1,1-dichloroethene concentration was below its Historic M2SD (Figure 2-4). The uranium-238 concentration was well below the Background M2SD.

Plume Degradation Wells: Twelve Plume Degradation wells were visited in the first quarter of 2000. Four wells were dry. No reportable occurrences were found. For eight compounds over five wells the Tier I Action Level was surpassed.

Plume Degradation well 18199 at IHSS 118.1 showed non-reportable concentrations of carbon tetrachloride, chloroform and methylene chloride that were above the Tier II Action Levels. The carbon tetrachloride and methylene chloride were also high enough to be above their Tier I Action Levels. The carbon tetrachloride (Figure 2-11) and chloroform (Figure 2-16) concentrations have increased over the past year of sampling. The methylene chloride sample shows a similar increase but was associated with blank contamination (Figure 2-26). Routine quarterly monitoring (well 18199 is used to monitor IHSS 118.1 and as a D&D well for building 771) of this well is continuing.

Plume Degradation well 18299 contained concentrations of carbon tetrachloride, chloroform, methylene chloride and tetrachloroethene that were above their Tier II Action Levels but were not reportable. The carbon tetrachloride was also above its Tier I Action Level. Trend plots for these compounds are not available because only three samplings have been performed. The carbon tetrachloride (3300 to 3700 μg/L) and chloroform (1600 to 2900 μg/L) concentrations have increased since sampling began. The tetrachloroethene has also increased (25 to 48 μg/L) but not to the extent

18

that carbon tetrachloride and chloroform have. The methylene chloride concentration may be increasing but the last two samples were associated with laboratory blank contamination. Semi-annual monitoring of 18299 is continuing.

Plume Degradation well 18499 held carbon tetrachloride, chloroform and methylene chloride in amounts that were above their Tier II Action Levels but were not reportable. The carbon tetrachloride and methylene chloride were also above their Tier I Action Levels. Trend plots for these compounds are not available because only three sampling events have occurred. The carbon tetrachloride (58000 to 22000 μg/L) and chloroform (8750 to 4600 μg/L) have decreased over the three sampling events. The methylene chloride may be increasing (83.5 to 2400 μg/L) but the last two sampling events have associated lab contamination. Well 18499 will continue on its routine of semi-annual sampling.

Plume Degradation well 18599 had carbon tetrachloride, chloroform and methylene chloride that were above their Tier II Action Levels but were not reportable. The carbon tetrachloride and methylene chloride were also above their Tier I Action Levels. Trend plots for these compounds are not available because only three sampling events have occurred. . The carbon tetrachloride (31900 to 40000 μg/L) and chloroform (3520 to 5500 μg/L) concentrations have increased since sampling began. The methylene chloride is again complicated by laboratory contamination in the last two sampling event but may be increasing (47.4 to 2400 μg/L). Routine semi-annual sampling of well 18599 will continue.

Plume Degradation well 90099 had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above the Tier II Action Levels. The trichloroethene was also above the Tier I Action Level. The only other time this well was sampled (see also 90399 below) was in the third quarter of 1999 so no trend plots are available. The carbon tetrachloride (430 to 310 μg/L), tetrachloroethene (30 to 18 μg/L) and trichloroethene (820 to 710 μg/L) concentrations have declined. The methylene chloride may have increased (4 to 38 μg/L) but both results have associated laboratory contamination. Quarterly monitoring of 90099 will continue.

Plume Degradation well 90399 had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above their Tier II Action Levels. No trend plots are available. The carbon tetrachloride (380 to 450 μg/L), tetrachloroethene (10 to 13 μg/L) and trichloroethene (220 to 380 μg/L) concentrations have increased. The methylene chloride may also have increased (3 to 15 μg/L) but these results have associated laboratory contamination. Quarterly monitoring of 90099 will continue.

Plume Extent Wells: Twenty-one Plume Extent wells were visited in the first quarter, three of these were dry. Of the 18 Plume Extent wells sampled, 13 wells had analytes that exceeded Tier II Action Levels. From these 13 wells two wells had a total of 10 reportable analytical results.

Plume Extent wells 04591, 05091, 10194, 23096, 6186, 7086, 75992, P114389 and P313589 all had non-reportable uranium-233/234 and uranium-238 results that were above Tier II Action Levels. All these results were below the Background M2SDs. These wells will continue to be monitored on a routine schedule.

Plume Extent well 10994 had non-reportable selenium, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The selenium was below its Historic M2SD in the well (Figure 2-65) and the uranium-233/234 and uranium-238 were below their Background M2SDs. Well 10994 will be maintained on a routine semi-annual sampling schedule.

19

Plume Extent well 22896 contained reportable amounts of methylene chloride, tetrachloroethene, trichloroethene, nickel and nitrate/nitrite. The results for these analytes were above Tier II Action Levels. Because there are no 1991 to 1995 data to use for calculation of Historic M2SDs the results for methylene chloride, tetrachloroethene and trichloroethene are reportable. The results for nickel and nitrate/nitrite were above their Background M2SDs and they are also reportable. By inspection the tetrachloroethene (Figure 2-38) and trichloroethene (Figure 2-50) are within their normal ranges so no further action is anticipated. The methylene chloride result is high but is associated with laboratory contamination so again not further action is planned (Figure 2-27). The nickel result is also high but similar high results have occurred in the past and monthly sampling suites have already been completed for metals so no additional sampling is planned (Figure 2-60). Finally no additional sampling is planned for nitrate/nitrite because despite the limited number of samples the current result appears to be within its normal range (Figure 2-71). Routine sampling of well 22896 is being continued.

Plume Extent well 23296 contained reportable amounts of carbon tetrachloride, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene and trichloroethene. Non-reportable uranium-233/234 and uranium-238 were also present. Results for all these analytes were above Tier II Action Levels and trichloroethene was also above the Tier I Level. Note that this report covers three monthly VOC samples initiated by the 1999 Third Quarter RFCA Groundwater Monitoring Report (RMRS, 2000a). The third monthly sample that was collected in April 2000 is being reported here. Because this well was installed relatively recently, Historic M2SDs for any analytes are not available. The February carbon tetrachloride result was the highest recorded so far while the April result declined significantly (Figure 2-12). The value for cis-1,2-dichloroethene decreased for all three samples from the maximum recorded in October 1999 (Figure 2-18). The latest two cis-1,2-dichloroethene results are below the Tier II Action Level. All three methylene chloride results were above the Tier II Level. The March methylene chloride result was the highest recorded while the April result has declined significantly (Figure 2-28). The last five-methylene-chloride sampling events have all been associated with contamination at the laboratory. The tetrachloroethene sample for February sample was the highest ever recorded. The March and April samples were lower but still above the normal range for well 23296 (Figure 2-39). The trichloroethene results were also high in February (highest ever) and March while the April result was within the normal range (Figure 2-51). Monthly sampling for these VOCs at well 23296 has concluded so only routine quarterly sampling of this well for VOCs will be required. The uranium-233/234 and uranium-238 results (only one sampling event) were below their Background M2SDs so no further action on their part is required.

Plume Extent well 3586 had non-reportable results for vinyl chloride, manganese, uranium-233/234 and uranium-238. These results were all above their Tier II Action Levels. The vinyl chloride was well below its Historic M2SD and no further action is required (Figure 2-54). The manganese was above its Background M2SD but below its Historic M2SD so no additional sampling for metals are required (Figure 2-58). The uranium isotopes were both well below their Background M2SDs. Routine monitoring of well 3586 will continue.

RCRA Monitoring Wells: Eight RCRA monitoring wells were visited in the first quarter of 2000. Two wells were dry. Of the six sampled wells, one downgradient well exhibited two reportable results.

20

Downgradient RCRA Monitoring well 4087 had non-reportable uranium-233/234 and uranium-238 occurrences that were above their Tier II Action Levels. Both uranium isotopes were below the Background M2SD so no additional sampling is required. Well 4087 will be sampled routinely.

Upgradient RCRA Monitoring well 70193 had a non-reportable result for nitrate/nitrite (Figure 2-72). This result was considerably higher than the Tier II Action Level and is also considerably higher than previous samples collected at the well. The sample listed in Table 3-2 is for a duplicate, the real sample was also elevated. No further action is required for upgradient RCRA wells so routine monitoring at 70193 will continue.

Upgradient RCRA Monitoring well 70393 contained non-reportable quantities of 1,1-dichloroethene (Figure 2-3), tetrachloroethene (Figure 2-40), trichloroethene (Figure 2-52) and uranium-238 that were above Tier II Action Levels. The concentrations of the VOCs were below their Historic M2SDs for this well. The uranium-238 was below the Background M2SD. Routine monitoring will be continued at this well site.

Upgradient RCRA Monitoring well 70493 contained a non-reportable result for uranium-238. The uranium was above the Tier II Action Level but well below the Background M2SD. No further action is required at well 70493 so routine monitoring will continue.

Downgradient RCRA Monitoring well B206989 had reportable lithium and selenium. It also had non-reportable results for nitrate/nitrite, uranium-233/234, uranium-235 and uranium-238. Results for all the analytes were above Tier II Action Levels. Based on the 1999 Fourth Quarter RFCA Groundwater Monitoring Report (RMRS, 2000b) monthly sampling for metals was initiated. Samples were successfully collected in May and June of 2000 but the well was found to be dry in July. These results will be reported in the Second Quarter 2000 Groundwater Report. Note that well B206989 has not consistently provided water so not all analytes have Historic M2SDs based on 1991-1995 results. The current lithium and selenium results were reportable because they are part of increasing trends (Figures 2-57 and 2-67 respectively). The nitrate/nitrite results were above the Background M2SD but below the Historic M2SD for the well (Figure 2-73). And the uranium-233/234, uranium-235 and uranium-238 concentrations are below the Background M2SDs. As mentioned in the Fourth Quarter 1999 Report (RMRS, 2000b) the uranium-235 result has returned to below the Background M2SD after being above the M2SD the previous two quarters. Well B206989 will be monitored routinely until the results from the monthly metals monitoring over the summer of 2000 can be evaluated in the Second Quarter Report.

21

Table 3-1
RFCA Groundwater Monitoring Locations and Sample Collection Summary
First Quarter, 2000

Location	VOC's	Metals	Radionuclides				Water Quality Parameters

Abbreviations

MG/L = milligrams per liter

PCI/L = picocuries per liter

TR1 = First analytical run

TR2 = Second analytical run, usually implies dilution (also DL1, DIL)

TR3 = Third analytical run, etc.

UG/L = micrograms per liter

Lab Qualifiers

B = analyte present in both sample and method blank (MB) (organics)

B = detected concentration less than contract required detection limit (CRDL) but above instrument detection limit (IDL) (metals & other inorganics)

B = activity in the method blank exceeded the minimal detectable activity (MDA) (radionuclides)

D = sample run at a dilution (organics)

J = positively identified below sample quantification limit (SQL), result estimated (organics)

J = estimated quantification (inorganics & radionuclides)

U = target analyte not detected (all analytes)

Validation/Verification Qualifiers*

V/V1 = Valid

J/J1 = estimated

NJ/NJ1 = presumptively estimated

UJ/UJ1 = estimated at an elevated level of detection

R/R1 = rejected

1 = Unvalidated/Unverified member of TR1-TR2 pair.

Other pair member should be Validated/Verified.

(list in order from highest confidence to lowest)

*Validation is a more thorough review of laboratory package than verification.

29

ID = Insufficient Data to calculate Historic Mean + 2 Std. Deviations for 1991-1995

ND = Location has no Historic Data prior to 1995

4.0 REQUIRED ACTIONS

Decontamination and Decommissioning well 10498 had non-reportable results for methylene chloride, tetrachloroethene, uranium-233/234 and uranium-238. The tetrachloroethene was also above the Tier I Action Level. The uranium-233/234 and uranium-238 results are well below the Background M2SD. The methylene chloride result in well 10498 while much higher than previously recorded is from an analysis that contained blank contamination (Figure 2-23). The tetrachloroethene result has also risen greatly since the previous sampling event (Figure 2-35). Due to the accelerated plan for the removal of Building 123 a baseline for either methylene chloride or tetrachloroethene has not been established. Comparing the current downgradient-10498 results with upgradient wells 10098 and 10198 indicates that for both compounds 10498 results are well above any previous sampling event in either 10098 or 10198. (Results for methylene chloride and tetrachloroethene in 10098 and 10198 are equal to 1 µg/L, "U" non-detections.) This report constitutes notification of the appropriate authorities of the high amounts of methylene chloride and tetrachloroethene in well 10498.

Decontamination and Decommissioning well 10598 had non-reportable quantities of barium and cadmium that were above the Tier II Action Levels and also above the Background M2SD. As with the VOCs discussed in well 10498 these two metals have increased greatly over previous sampling events (Figures 2-55 and 2-56). Again, because of the accelerated removal of Building 123 no baselines for barium or cadmium are available. Comparing downgradient well 10598 to upgradient wells 10098 and 10199 shows that the current 10598 results for barium and cadmium are well above those from the other two wells. This report constitutes notification of the appropriate authorities of the high amounts of barium and cadmium in well 10598.

Drainage well 6486 also had a reportable occurrence of nickel. The concentration was above the Tier II Action Level and the Background M2SD (there are not enough data points during 1991 to 1995 to calculate a Historic M2SD, Figure 2-59). A series of monthly samples at well 6486 has not been collected so a set will be started immediately. This will satisfy the decision rule IMP requirements. Note that well 6486 has had limited amounts of water in the recent past and may not provide enough water for the three month suite.

Required Monthly Monitoring - **Completed**

From the Fourth Quarter 1999 Report (RMRS, 2000b) Plume Extent well 1786 had a reportable result for selenium that exceeded the Tier II level. The selenium concentration was above both its Background M2SD and Historic M2SD levels. Monthly sampling for selenium at well 1786 was required and was successfully carried out in May, June and July of 2000. Results will be reported in the Second Quarter 2000 Report.

Also from the Fourth Quarter 1999 Report Plume Extent well 22796 had a reportable quantity of chromium that was above the Tier II Action Level. Chromium was present in an amount greater than the Background M2SD. Monthly sampling for chromium at well 22797 was successfully completed in May, June, and July. Results will be reported in the Second Quarter 2000 Report.

From Fourth Quarter 1999 Report and also this report Downgradient RCRA Monitoring well B206989 had reportable lithium and selenium results that were above Tier II Action Levels. Both lithium and selenium concentrations were above the Background M2SDs. The required monthly sampling for lithium and selenium was partly successful in that samples could be collected in May and June, unfortunately July was dry. Results will be reported in the Second Quarter 2000 Report.

7.0 GROUNDWATER DATA QUALITY ASSESSMENT – GENERAL INTRODUCTION

In this section, the quality of the analytical data is assessed in terms of five data-quality parameters: **precision, accuracy, representativeness, completeness**, and **comparability (PARCC)** as outlined by RMRS in "Procedure on the Evaluation of Data for Usability in Final Reports" (RMRS, 1998). This section summarizes the types of data available to assess the PARCC parameters.

With respect to the 83 sites visited in the first quarter of 2000, samples were obtained at 69 of the sites with 14 sites being dry. Ten sites provided only partial samples. Eight of the 69 sampled sites were selected for the collection of field Real/Duplicate samples. At six of the 69 sites field Rinsate samples were collected. On a per well basis overall frequency for field QC sampling is being maintained at 1 site in 20 (5%) over the course of this quarter's sampling program. Duplicates were collected at a ratio of 1 in 8.6 (11.6%) and rinsates at a ratio of 1 in 11.5 (8.7%). Field QC data from the first quarter are presented below.

Data used to evaluate the PARCC parameters were included in the data set compiled as described in Section 2.

Precision:

Precision is a measure of the reproducibility of analytical results. Precision is expressed quantitatively by the relative percent difference (RPD) between duplicate field samples for Metals, Polychlorinated Biphenyls, Volatile Organic Compounds, Waste Characteristics (Total Recoverable Petroleum Hydrocarbons) and Water Quality Parameters (WQPs) as defined by the following equation:

$$RPD = \frac{|(S-D)|}{(S+D)/2} \times 100$$

where: S = Concentration of analyte in Real Sample
D = Concentration of analyte in Duplicate Sample

With respect to Radionuclides the RFETS Groundwater Program uses the following "Duplicate Error Ratio" equation:

$$DER = \frac{|S-D|}{\sqrt{[(TPU_S)^2 + (TPU_D)^2]}}$$

where TPU_S = Total Propagated Uncertainty of the Sample
TPU_D = Total Propagated Uncertainty of the Duplicate or Lab Replicate
S = Sample Result
D = Duplicate or Lab Replicate Result

Because TPU is seldom reported (except possibly for Tritium-H3 analyses) in the laboratory data records, 2-Sigma Error has been substituted for TPU in the Uranium, Americium/Plutonium and Strontium calculations made for this report. TPU was not reported for first quarter Tritium analyses, so 2-Sigma Error was also substituted in the DER calculation for Tritium.

Individual RPDs/DERs can be found in Table 7-1. The QC criterion for RPDs is ≤30%, for DERs the criterion is ≤1.96. Table 7-2 gives a summary of the Overall Precision Compliance for RPDs and DERs. (Note: No duplicate samples for $Cesium_{137}$ or Total Cyanide were collected during this quarter.)

59

Accuracy:

Accuracy is a measure of how closely an analytical result corresponds to the "true" concentration in a sample. Table 7-3 gives the contract-required detection limits (CRDLs) for the various analytes.

The first quarter 2000 determination of accuracy has been simplified by the presence of a complete data set derived from the SWD database. With respect to analytical results retrieved from electronic files, detection limits are readily available.

Matrix spike recoveries for VOC, PCB, metal, waste characteristic and WQP samples (Table 7-4) and lab control sample recoveries for radionuclide samples (Table 7-5) are available for the first quarter. Acceptable criteria for matrix spikes and lab control samples are between 80 and 120 percent recovery. These tables give additional information on the accuracy of analyses by the laboratories.

Representativeness:

The discussion of representativeness in this section is limited to an evaluation of whether analytical results for field samples are truly representative of environmental concentrations or whether they may have been influenced by the introduction of contamination during collection and handling. The potential introduction of contamination is evaluated by examination of the analytical results for equipment rinsates (Table 7-6). Equipment rinsates are used to assess the efficacy of the decontamination process and possible cross-contamination between environmental samples. They are samples of volatile free "distilled" water that have been poured over or through decontaminated sampling equipment and subsequently handled in the same manner as environmental samples.

Although rinsates are used specifically as indicators of cross-contamination during decontamination of equipment, they are carried through the entire sampling, shipping, and laboratory process and are, consequently, also good indicators of potential contamination introduced during any of these steps. Because rinsate samples are judged to be adequate to assess introduced contamination, the groundwater program does not use trip blanks.

Other aspects of representativeness such as numbers of samples and spatial distribution are fixed in the Groundwater Integrated Monitoring Plan (DOE, 1999). As determined by the IMP, all required wells for this quarter were visited. See Figure 1 for reference to the spatial distribution of the samples.

Completeness:

Except in the case of three sulfate and three fluoride analyses which were not performed because the COC and bottle labels were incorrectly filled out, all samples specified in the IMP were collected unless well disposition was prohibitive (i.e. the well was dry or went dry during sampling). Table 3-1 presents a summary of sample collection and well disposition.

Table 7-7 compares the Actual Number of Samples taken in the first quarter to the Required Number of Samples. The completeness goal of 90% was met in 1 of 18 analyte groups (see below). All required wells were visited (some more than once) and all analytical results for the first quarter had been received prior to the writing of this report.

Completeness as a quantitative measure of data quality may be expressed as the percentage of valid or acceptable data obtained from a measurement system. In the first quarter 7248 analytical records were either Validated or Verified. Fifteen $Cesium_{137}$ and Dissolved Gas records were not (0.2%). Where available, validation/verification data for each sample are listed in Appendix A. Table 7-8 summarizes the validation completeness based on the following formula:

Dp_u = Percentage of usable data points
DP_t = Total number of data points
DP_n = Non-usable data points

$$\text{Completeness} = Dp_u = \frac{DP_t - DP_n}{DP_t} \times 100 \text{ (in percent)}$$

The completeness criterion is $\geq$ 90%.

Comparability:

During the first quarter of 2000 planned analytical methods for VOCs, WQPs, and Radionuclides remained consistent over the sampling period (see below for metals). No new analytical suites were introduced in the first quarter. Note that analyses previously listed under Methane are now classified under Dissolved Gasses. Table 7-3 lists the required methods for the various analytes. Laboratory analyses were performed according to standard CLP protocols and results should be comparable to data produced by similar methods.

In the fourth quarter of 1998 the sampling procedure was modified in order to enhance the quality of the samples collected and also reduce the amount of purge water generated at certain wells. This practice has continued into the first quarter of 2000.

Some wells with adequate recharge rates had dedicated bladder pumps installed. Pump equipped wells provide an opportunity for "micropurging" at the time of sampling. Micropurging has several advantages. Micropurge sample collection provides a method of minimizing increased colloid mobilization by removing water from the well at the screen interval at a rate that preserves or minimally disrupts steady-state flow conditions in the aquifer. During micropurge sampling, groundwater is discharged from the aquifer at a rate that minimizes drawdown at the well. Research indicates that colloid mobilization will not increase above steady-state conditions during low-flow discharge. Therefore, the collected sample is more likely to represent insitu groundwater chemistry. In addition, less water is needed to purge the pump system compared to purging the entire well with a bailer. Thus there is less purge water to dispose of.

The installation of bladder pumps and micropurging without sample filtration resulted in a change in analytical method for metals. Pump equipped wells are sampled and analyzed for total metals because no filter is used during sample collection. Bailed well samples are filtered and analyzed for dissolved metals.

61

DISCUSSION OF ANALYTE GROUPS

7.1 METALS

Precision:

There were 189 records for paired duplicate samples versus 1485 real sample records in the data set for metals in the first quarter, 2000 (1 in 7.9, 12.7%). Of the 189 real/duplicate pairs there were 153 records in which a Relative Percent Difference (RPD) could be calculated (Table 7-1). Of the 153 metal RPDs 119 were within the QC criterion of ≤30% for water (Table 7-2). Thirty-four RPD pairs for were outside the 30% criterion. Thus 78% of the metal RPDs meet the QC criterion overall precision for dissolved metal analysis is below the goal of 85%.

Of the 34 RPD pairs not meeting the precision criterion, 17 pairs had results less than 1 μg/l which implies that analytical accuracy would also be an important factor in considering the reliability of these results. Most of these same results were also "U" or "B" qualified by the laboratory meaning they were non-detections or the result was above the instrument detection limit but below the CRDL, again indicating that small quantities of metal are being considered. Similarly, many of the results were validated with "J", "J1", "UJ" or "UJ1" qualifiers indicating that the results are non-detections or estimates in some way. Three of the RPD-pairs were rejected in the validation process ("R" or "R1" qualified).

No metal or group of metal analytes appear to dominate those that exceeded the 30% RPD QC criterion.

The recommended frequency for duplicate samples is 1 in 20 on a per sample basis (see above). In the first quarter, 7 of 87 of all wells visited were analyzed for metals as Real/Duplicate pairs, a ratio of 1 in 12. Thus the Duplicate sampling frequency was within the requirements for the first quarter on both a per well and per sample basis.

Accuracy:

Contract-required-detection limits (CRDLs) for total and dissolved selenium, silver and thallium were exceeded as follows. One laboratory, RECRL, did the analyses.

Selenium:	detection limit = 1.1 μg/l	CRDL = 1.0 μg/l
Silver:	detection limit (2 values) = 0.2 or 0.22 μg/l	CRDL = 0.1 μg/l
Thallium:	detection limit (2 values) = 0.92 or 1.1 μg/l	CRDL = 0.5 μg/l

Of 32 analyses for selenium, 18 were Laboratory Qualified as either "U" or "B and all are usable data points based on validation/verification. Three of the unqualified selenium results were above the Tier II Action Level of 50 μg/l they are listed in Table 3-2. Of 68 silver analyses none were above the Tier II Action Level of 0.1 μg/l. Only one silver analysis was an unqualified lab detection, all others were either "U" or "B" qualified. All silver results are usable based on validation. All 68 thallium results are also "U" or "B" Laboratory Qualified and represent usable data points. No thallium results were above the Tier II Action Level of 2.0 μg/l.

All metal analyses were performed using the proper contract required methods listed in Table 7-3 in the first quarter of 2000.

42

Table 7-4 gives matrix spike recoveries for metals based on the electronic information submitted with RINs collected in the first quarter. The results in Table 7-4 show that 6 of 165 (3.6%) matrix spikes were outside the matrix spike criterion of 80-120% including calcium (1), lithium (4) and potassium (1).

With respect to methods the results for the first quarter in general are accurate.

Representativeness:

There were 162 rinsate records versus 1674 real and duplicate sample records for metals from the first quarter 2000 (1 in 10.3) (Table 7-6). Of the 162 rinsate records 160 (98.7%) were lab qualified as either "U" (non-detection-76), "B" (detection was less than Contract Required Detection Limit but greater than Instrument Detection Limit-82) or "BE" (detection less than CRDL as above – an estimate due to interference-2). None of the detections were above the Tier II Action Levels. This indicates that in general no metal contamination was introduced during sampling and/or shipping activities.

Completeness:

Table 7-7 indicates that 62 wells were to have been sampled for metals in the first quarter 2000. Dry wells or wells that went dry during sampling resulted in the collection of 55 actual samples, a success ratio of about 88.7%. The goal, groundwater conditions permitting, is to have greater or equal to 90% successful sampling.

Validation/Verification completeness is summarized in Table 7-8. The validation process is complete with respect to metals all results were validated (100%). Of the 1836 real, duplicate and rinse metal analyses that were validated or verified in the first quarter 98.7% of the analyses are usable. Eight-aluminum, four-mercury and 12-zinc analyses were rejected. Metal analyses for the first quarter are considered to be complete with respect to validation and verification.

Comparability:

As stated in Section 2 no changes were made to analytical procedures in the first quarter of 2000. Thus analyses from the first quarter are assumed to be comparable to previous analyses.

7.2 RADIONUCLIDES

Precision:

The data set for radionuclides contains 39 duplicate records versus 265 real records (1 in 6.8, 14.7%). A Duplicate Error Ratio (DER) could be calculated for 12 of the 39 paired real to duplicate records (Table 7-1). Eleven of the 12 DER values (91.6%) are below the 1.96 criterion (Table 7-2). The goal for DER values is to have 85% compliance. Precision for first quarter radionuclide data is considered to be adequate.

Accuracy:

Required detection limits for the 265 real and duplicate radionuclide analyses performed in the first quarter 2000 are given in Table 7-3. Except for one analysis all radionuclide analyses performed in the first quarter met the contract required detection limits. Well 70493 had a uranium-233/234

63

detection limit of 1.103 pCi/L compared to a CRDL of 1.0 pCi/L. The actual result for uranium-233/234 in 70493 was 2.472 pCi/L this is above the Tier II Action Level of 1.06 pCi/L but below the uranium-233/234 Background M2SD. This result is included in Table 3-2. In general, this part of accuracy assessment for radionuclide analyses appears to be good.

All radionuclide analyses were performed using the proper contract required methods in the first quarter of 2000 (Table 7-3). With respect to methods the results for the first quarter are accurate.

Table 7-5 gives the Laboratory Control Sample Recoveries for radionuclides collected in the first quarter. For the 111 records in Table 7-5 there are 75 (67.6%) that contain recoveries that were within the required range of 80-120%. Twelve entries have no LCS Fractional Sample Recovery entry (1 cesium, 2 gross alpha, 2 gross beta and 7 tritium). Twenty-three entries fall below the required range and one falls above. Accuracy with respect to Lab Control Sample Recovery could be improved.

Representativeness:

There were 31 records from 6 rinsate locations for radionuclides collected in the first quarter (Table 7-6). This represents a ratio of 1 in 16.4 with respect to the 304 records for real and duplicate analyses.

All rinsate analyses were below Tier II Action Levels. Twenty-seven of the 31 analyses were designated as "U" (non-detects) by the laboratories. Of the four remaining results 3 consist of "J" qualified (i.e. estimates) and one is a detection. All four results are below their respective Tier II Action Levels. All radionuclide rinsate results were verified and all results are usable data points. There is little indication of introduced radionuclide contamination during sampling activities in the first quarter of 2000.

Completeness:

Table 7-7 indicates that the success ratio for radionuclide sample collection varied widely. This was due to dry wells or wells that went dry during sampling. All wells that required radionuclide sampling were visited at least once in the first quarter. The success ratios for the various radionuclide analytes were 76.2% for plutonium/americium, 83.1%-uranium isotopes, 82.4%-tritium, 100%-strontium$_{89/90}$ and 50% for cesium$_{137}$. The completeness goal of 90% was met only in the case of strontium$_{89/90}$ for the first quarter.

Except for 3 cesium$_{137}$ analyses, which are done by task order (a special arrangement with the laboratory and where no validation procedure has been defined), all radionuclide results have been validated and provide usable data points (Table 7-8). Radionuclide analyses are judged to be complete with respect to validation and verification.

Comparability

No changes were made to analytical procedures in the first quarter of 2000. Thus the radionuclide analyses presented here are assumed to be comparable to previous analyses.

64

7.3 VOLATILE ORGANIC COMPOUNDS

Precision:

There were 464 duplicate records versus 4060 real records for volatile organic compounds in the first quarter (1 in 8.8 samples, 11.4%). Of the 348 real/duplicate pairs a relative percent difference (RPD) could be calculated for 17 pairs (Table 7-1). Of the 17 paired RPDs 15 were below the 30% criterion (88.2 %) (Table 7-2). The two analytes that had RPDs that lay outside the RPD criterion were methylene chloride. All the real and duplicate analyses associated with these RPDs were lab qualified as "JB" which indicates that the result is an estimate with some blank contamination. With a goal of 85% meeting the 30% RPD criterion analyses of volatile organic compounds for the first quarter of 2000 are judged to be precise.

Accuracy:

Required detection limits for VOC analyses are given in Table 7-3. The Contract Required Detection Limits (CRDLs) were met in the first quarter except in the following cases. In these cases where a whole RIN is cited the detection limit reported by the laboratory causes all contract required detection limits to be exceeded for that analytical run.

VOCs by EPA 524.2 Method (all compounds have a 1 µg/l CRDL and were analyzed by RECRL)

Well 90099 (Real-TR1) RIN 00D1070 run at 50x dilution, detection limit 50 µg/l, 58-results
Well 07391 (Real-TR1) RIN 00D1070 run at 5000x dilution, detection limit 5000 µg/l, 58-results
Well 05691(Real-TR1) RIN 00D1077 run at 10x dilution, detection limit 10 µg/l, 58-results
Well 0487 (Real-TR1) RIN 00D1077 run at 10x dilution, detection limit 10 µg/l, 58-results
Well 00491 (Real-TR1) RIN 00D1087 run at 10x dilution, detection limit 10 µg/l, 58-results
Well 15699 (Real-TR1) RIN 00D1087 run at 100x dilution, detection limit 100 µg/l, 58-results
Well 12691 (Real-TR1) RIN 00D1101 run at 25x dilution, detection limit 25 µg/l, 58-results
Well 12691 (Dup-TR1) RIN 00D1101 run at 25x dilution, detection limit 25 µg/l, 58-results
Well 10498 (Real-TR1) RIN 00D1123 run at 100x dilution, detection limit 100 µg/l, 58-results
Well 10498 (Dup-TR1) RIN 00D1123 run at 100x dilution, detection limit 100µg/l, 58-results
Well 891COLWEL (Real-TR1) RIN 00D1126 run at 25x dilution, detection limit 25 µg/l, 58-results
Well 90399 (Real-TR1) RIN 00D1126 run at 50x dilution, detection limit 50 µg/l, 58-results
Well 23296 (Real-TR1) RIN 00D1126 run at 100x dilution, detection limit 100 µg/l, 58-results
Well 22896 (Real-TR1) RIN 00D1135 run at 200x dilution, detection limit 200 µg/l, 58-results
Well 23296 (Real-TR1) RIN 00D1166 run at 50x dilution, detection limit 50 µg/l, 58-results
Well 18199 (Real-TR1) RIN 00D1166 run at 1000x dilution, detection limit 1000 µg/l, 58-results
Well 18199 (Real-TR2) RIN 00D1166 run at 5000x dilution, detection limit 5000 µg/l, 58-results
Well 18199 (Dup-TR1) RIN 00D1166 run at 1000x dilution, detection limit 1000 µg/l, 58-results
Well 18199 (Dup-TR2) RIN 00D1166 run at 5000x dilution, detection limit 5000 µg/l, 58-results
Well 18299 (Real-TR1) RIN 00D1166 run at 100x dilution, detection limit 100 µg/l, 58-results
Well 18299 (Real-TR2) RIN 00D1166 run at 500x dilution, detection limit 500 µg/l, 58-results
Well 18499 (Real-TR1) RIN 00D1166 run at 1000x dilution, detection limit 1000 µg/l, 58-results
Well 18599 (Real-TR1) RIN 00D1166 run at 1000x dilution, detection limit 1000 µg/l, 58-results
Well 95199 (Real-TR1) RIN 00D1175 run at 2x dilution, detection limit 2 µg/l, 58-results
Well 95199 (Real-TR2) RIN 00D1175 run at 5x dilution, detection limit 5 µg/l, 58-results

65

These 1450 results represent 20 chances in which the 1 µg/l CRDL was not met at a particular location. In total here were 81 chances to meet the VOC CRDLs in the first quarter. (Each chance represents an opportunity for the analysis to meet the CRDL. There is one chance allotted per real analysis and one chance per duplicate analysis. A TR1-TR2 pair is counted as one chance. Rinse analyses because of low analyte concentrations generally do not have dilution problems.)

Table 7-4 gives the matrix spike results for VOCs. The acceptable matrix spike criterion is to have the recovery be between 80% and 120% (inclusive). With respect to matrix spikes for VOCs, 58 entries out of 812 (7.1%) were outside the range of 80-120%, 754 entries were within the criterion (92.8%).

All VOC analyses were performed using the proper contract required methods in the first quarter of 2000 (Table 7-3). With respect to methods the results for the fourth quarter are accurate.

Representativeness:

There were 348 rinsate records from six wells for Volatile Organic Compounds for the first quarter of 2000 (Table 7-6). This represents a ratio of 1 in 13.0 (7.7%) with respect to the 4524 real and duplicate analyses. The number of rinses taken in the first quarter is greater than the 1 in 20 (5%) requirement.

All rinsate analyses were at or below detection limits and were lab qualified as non-detects ("U") or estimates ("J") except in three cases. These three results were "JB" qualified by the laboratories indicating that the result is an estimate with the analyte being present in the associated method blank. All of the three results were for methylene chloride. The actual result values were well below the Tier II Action Levels. Four rinsate records for 1,2-dibromo-3-chloro-propane were rejected in validation, a compound that has not been found to be a concern at RFETS. The VOC samples are judged to be representative.

Completeness:

Table 7-7 shows that 82 wells were to have been sampled for VOCs within the first quarter, 2000. Because of dry wells only 69 VOC samples could actually be collected. That translates to a success ratio of 84.1% for VOCs. This is below the goal of collecting 90% of the required samples. Nevertheless sampling for VOCs in the first quarter is judged to be complete because all wells were visited as specified by the IMP.

All VOC and samples collected in the first quarter of 2000 were validated on the assumption that the holding time for unpreserved VOC vials is 7 days. The RFETS groundwater program uses a 14-day hold time based on recent CDPHE guidance (CDPHE, 1998). Because of the 7-day hold time criteria, sample results may have received an erroneous "J" or "J1"validation qualifier if no other factors affected the analyses.

All VOC samples for the first quarter of 2000 were validated or verified (Table 7-8). VOC results for 4817 records are useable (98.8%) and 55 data are not usable (1.1%). All 55 unusable data records are for 1,2-dibromo-3-chloro-propane (see discussion of VOC rinse analyses above). From the standpoint of validation/verification qualification as it pertains to accuracy, VOC results from this quarter are good.

Comparability:

As stated above no changes were made to analytical procedures in the first quarter of 2000. Thus the VOC analyses presented here are assumed to be comparable to previous analyses.

7.4 WATER QUALITY PARAMETERS

Precision:

There were 25 duplicate sample records versus 165 real sample records for Water Quality Parameters (WQPs) during the first quarter (1 in 6.6, 15.2%). Of the 25-real/duplicate pairs, 24 could be used to generate Relative Percent Difference (RPD) values (Table 7-1). Twenty-two of 24 values (91.7%) were within the QC criterion of ≤30% (Table 7-2). The two calculations that did not meet the criterion were for cyanide and dissolved organic carbon. In general the results presented here indicate good precision for water quality parameter analyses.

Accuracy:

Electronic data indicate that the contract required detection limits were met for all WQP analyses (Table 7-3).

All WQP analyses were performed using the proper contract required methods in the first quarter of 2000 (Table 7-3). With respect to methods the results for the first quarter are accurate.

Table 7-4 gives the matrix spike results for WQPs for the first quarter 0f 2000. Fifty-one of 52 results shown in the table are within the acceptable 80-120% recovery range (98.1%). Analytical results for water quality parameters are judged to be accurate for the first quarter of 2000.

Representativeness:

There were 15 equipment rinsate results from six different wells for water quality parameters in the first quarter (Table 7-6). This represents a ratio of 1 in 12.7 (7.9%) with respect to the 190-real/duplicate analyses.

Ten of the 15-rinsate analyses were classified as non-detections ("U") by the laboratories (66.6%). The lab did not qualify the remaining results for total dissolved solids (4) and total cyanide (1). Total dissolved solids do not have a Tier II Action Level and these four results are the lowest results collected for the quarter (except for the other "U" qualified rinses shown in Table 7-6). The cyanide result is low and well below the cyanide Tier II Action Level. All the WQP rinsates were qualified as "J", "J1" or "V1" in validation. With respect to Water Quality Parameters for the first quarter it appears that there is little indication of significant introduced contamination.

Completeness:

Table 7-7 indicates that for Water Quality Parameters sampling completeness was highly variable due largely to the availability of water at the wells. Success ranged from 87.9% sampled for nitrate/nitrite to 50% for total cyanide (only 6 wells to be sampled). Three sulfate and three fluoride samples from one RIN were missed because the bottle labels and chain of custody were not filled out specifying that these analyses be run at the same time the total dissolved solids was being run. The completeness goal of 90% was not met for any of the Water Quality Parameters.

67

All of the Water Quality Parameter samples collected this quarter (100%) gave usable results with respect to validation/verification (Table7-8). Therefore, the first quarter is complete with respect to this criterion.

Comparability:

As stated above no changes were made to analytical procedures in the first quarter of 2000. Thus the WQP analyses presented here are assumed to be comparable to previous analyses.

Summary of RPD and DER Results
Groundwater - First Quarter, 2000

Analyte Group	QC Criterion for RPD or DER Value	Original Number of Available Real/Dup Pairs	Number of RPDs/DERs Calculated	Number of RPDs/DERs Within Criteria	Overall Precision Compliance (Goal = 85%)
Radionuclides	less than 1.96	39	12	11	92%
Organic Compounds	less than 30%	467	17	15	88%
Metals	less than 30%	189	153	119	78%
Water Quality Parameters	less than 30%	25	25	23	92%

Based on 720 original Real-Duplicate pairs, not counting TR2, TR3, etc. runs.

Calculation Criteria	Lab Qualifier = "U"		Lab Qualifier = "B"		Lab Qualifier = "J"	
	Meaning	Action	Meaning	Action	Meaning	Action
Radionuclides	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Activity in the method blank exceeded the minimal detectable activity (MDA).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.
Organics	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Analyte in both sample and associated method blank.	Calculation made.	Result is estimate.	Calculation not made for "J" or "JB" data when result is less than CRDL.
Metals	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Result detected was less than contract required detection limit (CRDL) but greater than the instrument detection limit (IDL).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.
Water Quality Parameters	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Result detected was less than contract required detection limit (CRDL) but greater than the instrument detection limit (IDL).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.

Table 7-3
Contract Required Detection Limits for Groundwater Analytes

CAS #	Analyte	Required Method	RDL	Units
	Dissolved Gas Analyses

Table 7-7
RFCA Groundwater Monitoring Sample Comparison:
Required versus Actual First Quarter, 2000

Sample Types		Required Number of Visits	Actual Number of Visits*	Actual Number of Samples Collected	Deviation	Success Ratio; % Samples Collected (or Wells Visited)	Discrepancy Justification
Groundwater Wells (Visits)		83	83	NA	0	100.0	NA
VOC's		82	82	69	13	84.1	Dry
Metals		62	62	55	7	88.7	Dry or Insw
Dissolved Gasses		8	8	5	3	62.5	Dry
Radionuclides							
	Pu/Am	42	42	32	10	76.2	Dry or Insw
	U-isotope	65	65	54	11	83.1	Dry or Insw
	Tritium	17	17	14	3	82.4	Dry or Insw
	$Strontium_{89/90}$	10	10	10	0	100.0	NA
	$Cesium_{137}$	6	6	3	3	50.0	Insw
Water Quality Parameters							
	Chloride	8	8	5	3	62.5	Dry
	Total Cyanide	6	6	3	3	50.0	Insw
	Diss. Organic Carbon	8	8	5	3	62.5	Dry
	Total Organic Carbon	8	8	5	3	62.5	Dry
	Fluoride	17	17	10	4	58.8	Dry/Insw/Missed
	Nitrate	8	8	5	3	62.5	Dry
	Nitrate/Nitrite	58	58	51	7	87.9	Dry or Insw
	Sulfate	40	40	27	22	67.5	Dry/Insw/Missed
	Sulfide	8	8	5	3	62.5	Dry
	TDS	59	59	49	10	83.1	Dry or Insw
Totals		512	512	407	111	79.5	Dry or Insw

*Does not reflect multiple visits to dry wells.
Dry = Well did not recharge after purging. No samples collected.
Insw = Insufficient water to complete sample suite.

Usable data points include the following Validation/Verification qualifiers: J/J1, JB/JB1, U/U1, UJ/UJ1, V/V1.
Non-usable data points include the following Validation/Verification qualifiers: R/R1.

Because Cesium and Methane analyses are set up via special contracts they are not being validated at this time.

With respect to TR1-DL1 or TR1-TR2 analytical series, only one Result from a pair (with a validation qualifier) is counted here.

Completeness = $Dp_u = \frac{DP_t - DP_n}{DP_t} \times 100$ (in percent)

The acceptable QC criterion is **>90%.**

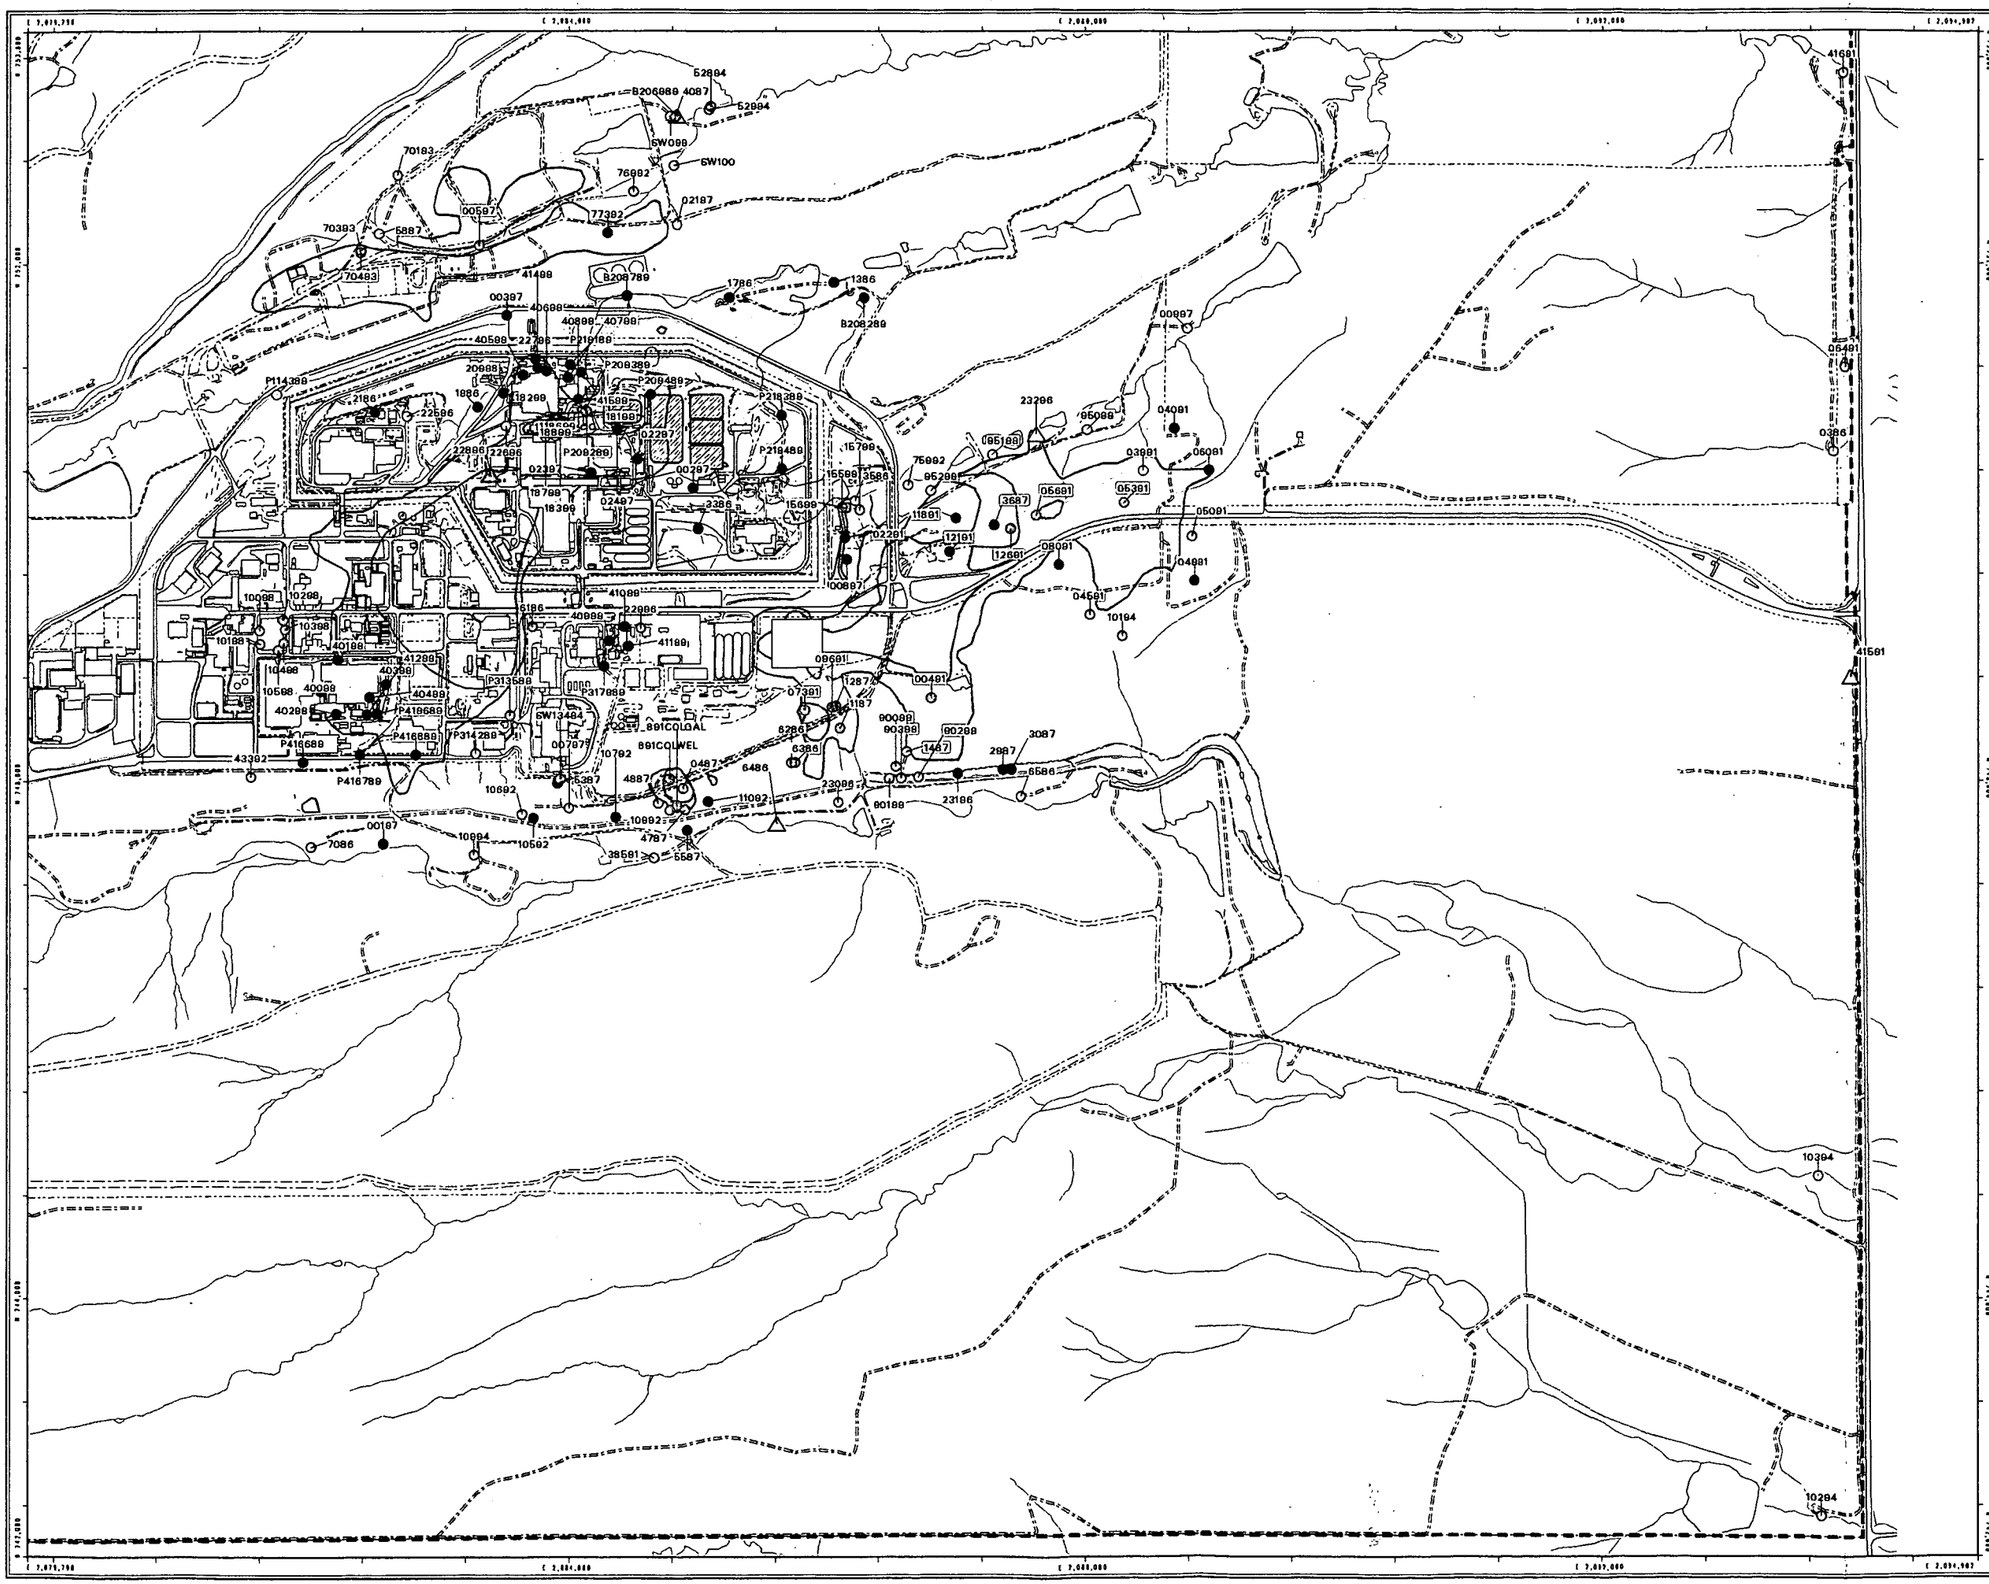

Figure 1

Regulatory Required Groundwater Monitoring Wells

Selected VOC & Nitrate Plumes Fourth Quarter, 1999 Reportable Sample Analyses

EXPLANATION

- IMP Wells Not Sampled This Quarter
- IMP Wells Sampled/Visited This Quarter
- IMP Wells With Reportable Tier II Sample Analyses
- Composite VOC Groundwater Plume (100 X MCL)
- Composite VOC Groundwater Plume (concentration equal to MCL)
- 100 x Nitrate Standard (1000 mg/l)
- Nitrate Standard (10 mg/l)

Standard Map Features

- Buildings and other structures
- Solar Evaporation Ponds (SEP)
- Lakes and ponds
- Streams, ditches, or other drainage features
- Fences and other barriers
- Rocky Flats boundary
- Paved roads
- Dirt roads

DATA SOURCE BASE FEATURES:
Buildings, fences, hydrography, roads and other structures from 1994 aerial fly-over data captured by EG&G RSL, Las Vegas. Digitized from the orthophotographs. 1/95

N

Scale = 1 : 14020
1 inch represents approximately 1168 feet

250 0 500 1000ft

State Plane Coordinate Projection
Colorado Central Zone
Datum: NAD27
