EXECUTIVE SUMMARY

This report contains results of IMP required groundwater monitoring for the Third calendar quarter of 2000. Emphasis is placed throughout the presentation on features that are different or noteworthy compared to previous monitoring reports.

The report is organized into seven sections. Section 1 discusses any changes made since the preceding report. (For this report a new laboratory contract monitoring system is being implemented using General Engineering Laboratories as a test lab.) Section 2 gives a general overview of sampling for the quarter, data availability and manipulation, procedures and definition of well classes. Results for individual wells and Tier I and Tier II reportable occurrences are presented in Section 3. Required actions based on the current findings and completed actions from previous reports are given in Section 4. References appear in Section 5 and Maps and Trend Plots in Section 6. Quality Assurance issues are discussed in general and specifically with respect to analyte groups in Section 7. Finally the data for the quarter is presented in the four Appendices.

Groundwater sampling for the Third Quarter, 2000 included 75 locations. Of these, 13 locations were completely dry and a further 9 yielded only enough water to collect a partial analytical suite.

There was one reportable analytical result above the Tier I Action Level in the Third Quarter of 2000. Plume Definition well 22896 had a reportable Tier I exceedance for trichloroethene that was within the usual range for the well. There were 14 reportable Tier II results including one Boundary and one Drainage well for nickel and one downgradient RCRA well for sulfate. From eleven Plume Extent wells having Tier II exceedances, only well P314289 requires a suite of monthly samples for nickel.

Acronym List

ACCU	Acculab Inc. (Laboratory), Lakewood, Colorado
ALF	Action Level Framework
Background M2SD	Background mean plus 2 standard deviations (calculated on a site wide basis)
BOA	Basic Ordering Agreement
CAS	Chemical Abstract Service (Assigns a number used to identify analytes that may have multiple common names. The registry number is called a "CAS Number".)
CDPHE	Colorado Department of Public Health and Environment
CLP	Contract Laboratory Program
CRDL	Contract Required Detection Limit
D&D	Decontamination and Decommissioning
DER	Duplicate Error Ratio (calculated for real/duplicate radionuclide analyses)
DOE	United States Department of Energy
EPA	United States Environmental Protection Agency
GEL	General Engineering Labs Inc., Charleston, South Carolina
Historic M2SD	Historic mean plus 2 standard deviations (calculated on a per well basis)
IHSS	Individual Hazardous Substance Site
IMP	Integrated Monitoring Plan
KH	Kaiser-Hill, LLC
KH-ASD	Kaiser-Hill – Analytical Services Division (Receives data from laboratories, checks it and enters it into the Soil Water Database)
MCL	Maximum Contaminant Level
µg/l	microgram per liter
mg/l	milligram per liter
PARA	Paragon Analytics, Inc. (Laboratory), Fort Collins, Colorado
PARCC	Precision, Accuracy, Representativeness, Comparability and Completeness
PCB	Polychlorinated Biphenyl
pCi/l	picocurie per liter
PQL	Practical Quantitation Limit
QL	Quantitation Limit
RCRA	Resource Conservation and Recovery Act
RECRL	RECRA Environmental Inc. (Laboratory), Lionsville, Pennsylvania
RFCA	Rocky Flats Cleanup Agreement
RFETS	Rocky Flats Environmental Technology Site
RMRS	Rocky Mountain Remediation Services, LLC
RPD	Relative Percent Difference (calculated for non-radionuclide real/duplicate analyses)
SCA	Sanford Cohen & Associates Laboratory, Montgomery, Alabama
SOP	Standard Operating Procedure
SOW	Statement of Work
s.l.	"sensu lato" – refers to a general case
s.s.	"sensu stricto" – refers to a specific case
SWD	Soil Water Database
TRPH	Total Recoverable Petroleum Hydrocarbon
TDS	Total Dissolved Solids
Tier I	Analyte specific action level originally defined by RFCA, updated by IMP
Tier II	10^{-2} of Tier I
TPU	Total Propagated Error
TSS	Total Suspended Solids
VOC	Volatile Organic Compound

1.0 INTRODUCTION

This report is required by Section 3.4.B of Attachment 5 of the Rocky Flats Cleanup Agreement (RFCA) (EPA, CDPHE, DOE, 1996) and is described in the Integrated Monitoring Plan (IMP) (DOE, 1999).

The DOE/K-H/RMRS team has completed evaluation of Third Quarter (July-August-September) 2000 groundwater analytical data using groundwater action level criteria as described in RFCA Attachment 5 (Kaiser-Hill, 2000). The sampling for the Third Quarter of 2000 reflects the approval of the monitoring well list (CDPHE, Nov. 1996 and EPA, Nov. 1996) and the establishment of semi-annual sampling frequencies. Therefore, only a portion of the RFCA monitoring wells are sampled and reported each quarter. The remainder will be sampled in the following quarter as site conditions allow. RFCA groundwater monitoring locations and three sump/drain locations (see below) are included in this report. The locations sampled during the Third Quarter, 2000 are listed in Table 3-1. The locations of the sampled sites are shown in Figure 1a and 1b. Note the differentiation between Figures 1a and 1b. Figure 1a gives an overall view of the majority of the Rocky Flats Environmental Technology Site. Figure 1b focuses on just the industrial area. Plume outlines portrayed on Figures 1a and 1b have been updated to the most recent derived from the Final 1999 Annual Groundwater Report (RMRS, 2000c).

In addition to monitoring wells cited in this report three other locations are included: 891COLGAL, 891COLWEL and SW13494. The "891"-prefixed locations are pump equipped wells that collect water from the French Drain on the Building 881 hillside. Location SW13494 is a sump for the footing drain system of the 881 Building; it also is located on the 881 hillside.

Basic Ordering Agreement

The Third Quarter 2000 represents the first quarter in which a new DOE contract monitoring system was implemented at RFETS. The new system, the Basic Ordering Agreement or BOA, is a set of national contract requirements with site specific addendums. In the Third Quarter the BOA was implemented using the General Engineering Laboratory for testing the structure and operating procedures imposed by the BOA. With respect to this report the new agreement resulted in some delays in receiving data from the lab and some delays in getting the validation process completed. These delays are expected to disappear as the KH-ASD staff and laboratories become more familiar with the BOA requirements and procedures.

6

2.0 METHODS

The Groundwater Monitoring program attempted to collect and have analyzed 446 samples in the Third Quarter of 2000 under the Integrated Monitoring Plan (IMP) (DOE, 1999). Because of dry wells and wells with insufficient water only 349 requests for analysis were actually sent out. There were 75 uncollected samples related to dry wells and 22 related to insufficient water.

By the beginning of January 2000 approximately 96% of the results (6566 of 6841 records) pertaining to the Third Quarter 2000 were available electronically from the Soil and Water Database (SWD). The remaining 275 result records for radionuclides became available by the end of January. In general it was not necessary to manually compile data from the laboratory report packages. Results for all analyses that were sent out have been returned.

The analytical results were uploaded from SWD into a local MS Access database maintained by the groundwater group. Data were examined for their presence/absence and consistency. Duplications and mismatches were excluded. Field and laboratory QC data were identified for use in the data quality assessment section (Sec. 7.0) using a Rocky Mountain Remediation Services (RMRS) document: DRAFT: Quality Assurance Program Plan For The Groundwater Monitoring Program Rocky Flats Environmental Technology Site, May 2000 (RMRS, 2000a).

Results for all detected analytes (results without a "U" qualifier) were compared with Tier I and Tier II Action Level Framework (ALF) criteria. Results exceeding Tier I or Tier II action levels were further compared with the site-wide Background Mean plus Two Standard Deviations (M2SD) value and well-specific Historic Mean plus Two Standard Deviations (M2SD) value. The three ratios calculated as a result of these comparisons are used to identify IMP reportable results as described below. Volatile Organic Compounds are assumed to have zero background concentration. The Historic M2SD is only calculated for wells with 5 or more sampling events collected during the years 1991 to 1995.

Table 3-2 represents a screen for any results that exceed the Tier II Action Levels. Table 3-2 is used to evaluate the reportable results via the Tier II, Background and Historic Ratios as described above and to help select analytes and wells which are of interest for site cleanup but which may not be reportable under IMP criteria.

Background values were taken from the Background Geochemical Characterization Report (DOE, 1993) with the exception of americium-241, plutonium-239/240, uranium-233/234, uranium-235, and uranium-238. Background values for these radionuclides were taken from the Draft Background Comparison for Radionuclides in Groundwater Report (DOE, 1997). Data were extracted directly from the SWD and/or the local groundwater database to calculate the historical M2SD for locations with analytes exceeding Tier II ALF criteria and to produce trend plots.

Integrated Monitoring Plan (IMP) Well Class Definitions

The groundwater monitoring network, as defined in the IMP (DOE, 1999), contains eight categories of monitoring wells. The decision rule sequence presented in the IMP was followed for determining Tier I and II reportable results. The well types and decision rules are defined below:

Plume Definition Monitoring Wells: These wells are located within known contaminant plumes and are above Tier II action levels, but are below the Tier I action levels established in the ALF. A

7

reportable result occurs when a measured concentration exceeds a Tier I action level and the background value and the M2SD of the historical concentration in the well. The required action is to reclassify as a Tier I reportable result well and evaluate possible impacts to surface water.

Plume Extent Monitoring Wells: These wells are located at the edges of known groundwater contaminant plumes, along pathways to surface water. These wells monitor for an increase in concentrations that may result in future impacts to surface water. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no previous historical reportable results, or when a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

Drainage Monitoring Wells: These wells are located in stream drainages, downgradient of contaminant plumes. They have the same programmatic requirements as PE wells under the IMP. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no historical reportable results, or a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

Boundary Monitoring Wells: These wells monitor ground water leaving the eastern Site boundary through the stream drainage channels. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no historical reportable results, or a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

D&D Monitoring Wells: These wells monitor for releases to groundwater from decontamination and decommissioning (D&D) activities. A reportable result occurs when a measured concentration exceeds the M2SD of the established historical baseline concentration downgradient of the building(s). The required action is to inform appropriate parties and initiate an evaluation of the situation.

Performance Monitoring Wells: These wells monitor the effect of a remediation or source removal action, as required in the ALF. If an increasing trend in the concentration of a contaminant is noted, then the appropriate parties are notified and an evaluation of the situation is initiated.

RCRA Monitoring Wells: These wells monitor downgradient groundwater contaminant concentrations at RCRA units. If the mean concentration of a contaminant in a downgradient well exceeds the mean concentration in upgradient wells and concentrations at the well show an upward trend with time, a report will be made to appropriate agencies and an investigation will be initiated to determine possible causes. This evaluation will be performed in the annual RFETS RFCA Groundwater Monitoring Report.

8

For the purposes of the quarterly reports, analytical results from downgradient RCRA wells will be treated in the same manner as Plume Extent wells. A reportable result for a RCRA well occurs if a measured concentration exceeds a Tier II action level and the background value. When there are no historical reportable results, or a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated. As noted above a review of the relative concentrations of upgradient and downgradient wells will be performed in an annual report.

Plume Degradation Monitoring Wells: These wells are located either in downgradient areas that may be contaminated from a specific source or in associated upgradient areas. Data will be reviewed annually to determine if sufficient data have been collected to support remedial decision making. Upon collection of sufficient data an evaluation will be performed to establish inputs to the remedial conceptual model.

3.0 RESULTS

Seventy-five locations were visited in order to collect groundwater samples during the Third Quarter, 2000. Of the 75 wells visited 13 wells were completely dry and 9 wells yielded only enough water to collect a partial analytical suite. Table 3-1 summarizes data collection activities for the Third Quarter of 2000. All sample results for the Third Quarter have been received as of this writing.

Data features of particular interest under RFCA are presented in Table 3-2 and are summarized in the following discussion. Figures 1a and 1b illustrate the location of major plume boundaries relative to monitoring locations. Locations found to have reportable results for Tier I or Tier II Action-Level criteria are noted. Historic trend plots are shown for selected wells with analyte concentrations above Tier I or Tier II Action Levels (Figures 2-1 to 2-73). Other illustrated trends include organic compounds with concentrations exceeding Tier II action levels, and for any inorganic analytes with concentrations exceeding Tier II action levels and background M2SD. The RFCA (EPA, CDPHE, DOE, 1996) requires that this information be reported quarterly.

3.1 TIER I REPORTABLE RESULTS

There was one reportable analytical result above the Tier I Action Level in the Third Quarter of 2000 (Table 3-2). Well 22896 contained trichloroethene that was above the Tier I Level (Figure 2-45). Although the trichloroethene content of the water in 22896 was high, by inspection, the content was within the usual range for the well.

3.2 TIER II REPORTABLE RESULTS

Boundary Wells: Six Boundary wells were visited in the Third Quarter of 2000. One Boundary well was dry (10394). Well 41591 had a reportable result for nickel (discussed below) and non-reportable uranium-233/234 and uranium-238. The four remaining Boundary wells, 0386, 06491, 10294 and 41691, contained uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels but were not reportable. In all cases the measured quantities of the uranium isotopes were below their Background M2SDs.

Boundary well 41591 in addition to the uranium isotopes mentioned above contained a reportable quantity of nickel. The nickel was above the Tier II Action Level, the Background M2SD and the Historic M2SD for the well (Figure 2-55). The trend plot for nickel in well 41591 indicates that the concentration has been elevated since sampling of the well resumed after a 1997-1999 hiatus. The recent values have already been documented by a series of monthly samples so no additional monthly sampling at 41591 is required. The well will continue to be sampled on a semi-annual basis.

Decontamination & Decommissioning Wells: Seven Decontamination and Decommissioning (D&D) wells were visited in the Third Quarter, 2000. Four of these wells contained only enough water for collection of partial sample suites: 10098, 10198, 10298 and 10398. Wells 10198, 10298, 10398, 10598 and 60399 had no analytes above the Tier II Action Level. Two wells, 10098 and 10498 contained non-reportable results for analytes that exceeded the Tier II Action Levels.

Decontamination and Decommissioning well 10098 had non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Levels but well below the Background M2SDs. Well 10098 will continue on its routine schedule of monitoring.

Decontamination and Decommissioning well 10498 had non-reportable tetrachloroethene, nitrate, uranium-233/234 and uranium-238 analyses that were above their Tier II Action Levels. The

10

tetrachloroethene content decreased to a more usual level from the February 2000 sample (Figure 2-30). The result for nitrate increased since the February sampling and was again above the Tier II level (Figure 2-67). By inspection both the tetrachloroethene and nitrate were within their usual ranges. Results for the uranium isotopes were both well below their Background M2SDs. Well 10498 will be retained on its semi-annual monitoring schedule.

Drainage Wells: Four Drainage wells were visited in the Third Quarter of 2000. Wells 38591 and 6486 were dry. Wells 00997 and 6586 had analytes that were above Tier II Action Levels. The nickel in well 6586 was reportable.

Drainage well 00997 had uranium-233/234 and uranium-238 that were above their Tier II Action Levels but were not reportable. These uranium-isotope results were well below their Background M2SDs. Well 00997 will be monitored on a routine schedule.

Drainage well 6586 had a reportable result for nickel and non-reportable uranium-233/234 and uranium-238 results that were above the Tier II Action Levels. The uranium-233/234 and uranium-238 were well below their Background M2SDs. Nickel in well 6586 was reportable as it was above the Tier II Action Level, the Background M2SD and the Historic M2SD for the well (Figure 2-56). Concentrations above Tier II for nickel in well 6586 have been documented in the recent past and a suite of monthly samples was collected in 1998. No additional sampling is required or planned for well 6586.

Performance Monitoring Wells: Fourteen Performance monitoring locations were visited in the Third Quarter 2000. Three wells (15599, 15799 and 95299) were dry. All 11 of the sampled locations had analytes with concentrations that exceeded Tier II Action Levels. There were no reportable results for Performance Monitoring locations in the Third Quarter.

Performance Monitoring locations 00797, 10692 and 891COLGAL had non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Levels. These results were all below their Background M2SDs and therefore monitoring of the wells will continue in a routine manner.

Performance Monitoring well 05691 exhibited non-reportable results for carbon tetrachloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. The uranium isotope results were well below their Background M2SDs. The carbon tetrachloride (Figures 2-8), tetrachloroethene (Figure 2-28) and trichloroethene (Figure 2-41) analyses were below their respective Historic M2SDs for the well. Well 05691 will continue on its semi-annual schedule of sampling.

Performance Monitoring well 07391 contained non-reportable quantities of chloroform, methylene chloride, tetrachloroethene, trichloroethene, nitrate, uranium-233/234, uranium-235 and uranium-238. The quantities of these analytes were all above Tier II Action Levels. The methylene chloride, tetrachloroethene and trichloroethene were also over their Tier I Action Levels. Chloroform was below its Historical M2SD (Figure 2-14). Methylene chloride was above its Historical M2SD but was also "B" qualified by the laboratory indicating contamination was present in the method blank (Figure 2-19). The tetrachloroethene and trichloroethene were both below their Historical M2SDs (Figures 2-29 and 2-42). Nitrate in well 07391 declined from the maximum value recorded in January 2000. Nitrate continued a trend started in early 1999 and was above the both the Background M2SD and its Historical M2SD (Figure 2-66). Uranium-233/234 was above the Tier II but below the Background M2SD. Uranium-235 (Figures 2-72) and uranium-238 (Figure 2-73) were both above Tier II and Background M2SD levels. These two uranium isotopes have increased since early 1998.

11

Because 07391 is classified as a Performance Monitoring well by the IMP no additional monthly sampling is required and routine semi-annual sampling may continue.

Performance Monitoring well 10992 contained non-reportable quantities of selenium, nitrate, uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. Both selenium and nitrate were above their Background M2SDs while the uranium isotopes were both below their Background M2SDs. By inspection selenium (Figure 2-59) and nitrate (Figure 2-68) were within their normal ranges. Routine monitoring of well 10992 will continue.

Performance Monitoring well 12691 exhibited non-reportable results for carbon tetrachloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. Carbon tetrachloride was even above the Tier I Action Level. The carbon tetrachloride (Figure 2-9), tetrachloroethene (Figure 2-31) and trichloroethene (Figure 2-43) analyses were below their respective Historic M2SDs for the well. The uranium isotope results were below their Background M2SDs. Well 12691 will continue on its semi-annual schedule of sampling.

Performance Monitoring well 15699 contained 1,1-dichloroethene, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 in amounts that were above their Tier II Action Levels and that were not reportable. The tetrachloroethene and trichloroethene were also present in quantities high enough to be above Tier I Action Levels. By inspection the 1,1-dichloroethene (Figure 2-1), cis-1,2-dichloroethene (Figure 2-15), tetrachloroethene (Figure 2-32) and trichloroethene (Figure 2-44) concentrations were within their normal ranges. Interpretation of the methylene chloride concentration, which decreased since the Second Quarter 2000 sampling event, was again complicated by blank contamination at the laboratory (Figure 2-20). The uranium isotope results were below their Background M2SDs. Well 15699 will be maintained on a quarterly monitoring schedule.

Performance Monitoring location 891COLWEL had non-reportable 1,1-dichloroethene, carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, selenium, uranium-233/234 and uranium-238 that were above their respective Tier II Action Levels. The uranium-233/234 and uranium-238 were below the Background M2SDs. The 1,1-dichloroethene (Figure 2-3), carbon tetrachloride (Figure 2-11), tetrachloroethene (Figure 2-35), trichloroethene (Figure 2-48) and selenium (Figure 2-63) were within their normal ranges and below their Historic M2SDs. Methylene chloride (Figure 2-23) is above its normal Historic M2SD range as it was in 1997-1998. Note the methylene chloride result is again associated with "B" qualified blank contamination. Routine quarterly monitoring of location 891COLWEL will continue.

Performance Monitoring well 95199 had a non-reportable occurrence of trichloroethene that was above the Tier II Action Level. The trend plot of the trichloroethene results over the past four sampling events suggests that trichloroethene in the well is increasing (Figure 2-51). Well 95199 will continue to be monitored on a quarterly basis.

Performance-Monitoring location SW13494 had results for tetrachloroethene, uranium-233/234 and uranium-238 that were not reportable yet above the Tier II Action Levels. The tetrachloroethene concentration was within its normal range and below the Historic M2SD for the well (Figure 2-38). The uranium isotope concentrations were both well below their Background M2SDs. Location SW13494 will continue to be monitored on a quarterly basis.

Plume Definition Wells: Nine-Plume Definition wells were visited in the Third Quarter of 2000. One Plume Definition well (6386) was dry. In Plume Definition well 22896 here was one reportable

12

analytical result for trichloroethene that was above the Tier I Action Level. All eight sampled wells had at least one result that was above the Tier II Action Level.

Plume Definition well 00491 contained non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The carbon tetrachloride (Figure 2-5), tetrachloroethene (Figure 2-26) and trichloroethene (Figure 2-39) were within their normal ranges, below their Historic M2SDs. The methylene chloride result (18 μg/L) was the highest value recorded so far. The methylene chloride result was below its Historic M2SD but is associated with blank contamination at the laboratory (= "B" qualified, Figure 2-17). The uranium isotopes were both below the Background M2SDs. Routine semi-annual monitoring of well P209489 will continue.

Plume Definition well 00597 had a non-reportable result for nitrate that was above the Tier II Action Level and Background M2SD (Figure 2-65). Historically the Third Quarter result was the highest recorded and continued an increasing trend that began with the first sample collected in late 1997. Because the nitrate result was not reportable routine monitoring of well 00597 will continue.

Plume Definition well 03991 exhibited carbon tetrachloride, uranium-233/234 and uranium-238 that were not reportable but above the Tier II Action Levels. The carbon tetrachloride was below the Historic M2SD for the well (Figure 2-6). Uranium-233/234 and uranium-238 were well below their Background M2SDs. Routine monitoring of well 03991 is continuing.

Plume Definition well 0487 contained non-reportable methylene chloride, trichloroethene, selenium, uranium-233/234 and uranium-238. Methylene chloride (again "B" qualified by the laboratory, Figure 2-18) and trichloroethene (Figure 2-40) were below their Historic M2SDs. The selenium was above the Background M2SD but below its Historic M2SD (Figure 2-58). The uranium-233/234 and uranium-238 were below their Background M2SDs. Routine monitoring of 0487 will be continued.

Plume Definition well 05391 exhibited non-reportable results for carbon tetrachloride, tetrachloroethene, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. The carbon tetrachloride (Figure 2-7) and tetrachloroethene (Figure 2-27) analyses were below their respective Historic M2SDs for the well. The uranium isotope results were well below their Background M2SDs. Well 05391 will continue on its semi-annual schedule of sampling.

Plume Definition well 22896 had a reportable result for trichloroethene that was above the Tier I Action Level (Figure 2-45). Well 22896 also had non-reportable results for methylene chloride ("B" qualified, Figure 2-21) and nitrate (Figure 2-70) that were above their Tier II Action Levels. The nitrate is also above its Background M2SD. By inspection the three analytes are all within their normal historic ranges. The routine monitoring of well 22896 will continue.

Plume Definition well 6286 contained non-reportable carbon tetrachloride, selenium, uranium-233/234 and uranium-238. The carbon tetrachloride was below its Historic M2SD (Figure 2-10). The selenium was above the Background M2SD and just below its Historic M2SD (Figure 2-62). The uranium-233/234 and uranium-238 were well below their Background M2SDs. Routine monitoring of 6286 will continue.

Plume Definition well P209389 had non-reportable 1,1-dichloroethene that exceeded the Tier II Action Level but was below its Historic M2SD (Figure 2-4). Semi-annual monitoring is all that is required at well P209389.

13

Plume Degradation Wells: Four Plume Degradation wells were visited in the Third Quarter of 2000. One well, 90199, was dry and one well, 90299, contained no analytes above Tier II Action Levels. No reportable concentrations were found but well 90099 had trichloroethene that exceeded the Tier I Action Level.

Plume Degradation well 90099 had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above the Tier II Action Levels. The trichloroethene was also above the Tier I Action Level. By inspection carbon tetrachloride appeared to be decreasing (Figure 2-12). By inspection tetrachloroethene stayed relatively constant during 2000 (Figure 2-36) while trichloroethene increased after the Second Quarter 2000 sampling event (Figure 2-49). The methylene chloride results decreased slightly from the Second Quarter 2000 but because all four methylene chloride sampling events were associated with laboratory blank contamination ("B" qualified) their trend cannot be characterized (Figure 2-24). Quarterly monitoring of 90099 will continue.

Plume Degradation well 90399 also had non-reportable amounts of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above their Tier II Action Levels. By inspection, the carbon tetrachloride remained relatively constant although it was elevated (Figure 2-13). Tetrachloroethene (Figure 2-37) and trichloroethene (also elevated, Figure 2-50) increased after the Second Quarter but were within their normal ranges. The methylene chloride concentration decreased significantly from the Second Quarter 2000 sampling event but all results have associated laboratory blank contamination ("B" qualified, Figure 2-25). Quarterly monitoring of 90399 will continue.

Plume Extent Wells: Twenty-two Plume Extent wells were visited in the Third Quarter, three of these were dry (4787, 4887 and 76992). Of the 19 Plume Extent wells sampled 17 had analytes that exceeded Tier II Action Levels, wells 22596 and 22796 had nothing above Tier II. From the 17 wells, 6 wells had a total of 10 reportable analytical results. None of the Third Quarter Plume Extent results were over Tier I Action Levels.

Plume Extent wells 04591, 05091, 10194, 22696, 23096, 6186, 7086 (uranium-233/234 only), 75992, P114389 and P313589 all had non-reportable uranium-233/234 and uranium-238 concentrations that were above Tier II Action Levels. All these analytical results were below the Background M2SDs. These wells will continue to be monitored on a routine schedule.

Plume Extent well 10994 had reportable selenium and nitrate and non-reportable uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The uranium-233/234 and uranium-238 were below their Background M2SDs. Selenium was above the Background M2SD but below its Historic M2SD for the well (Figure 2-60). Nitrate exceeded the Background M2SD. Because the well has insufficient data to calculate a Historic M2SD for nitrate, by inspection the Third Quarter nitrate result was within its normal historic range (Figure 2-69). Well 10994 will be maintained on its routine semi-annual sampling schedule.

Plume Extent well 1386 had a reportable concentration of nickel that exceeded the Tier II Action Level. The nickel result was "E" qualified (estimate due to interference). Nickel was above both the Background M2SD and the Historic M2SD (Figure 2-54). The nickel concentration for the well has been above its Historic M2SD for the last two years. Well 1386 had a cycle of monthly sampling for nickel so no additional metal sampling is required. Well 1386 may continue on its routine semi-annual sampling schedule.

14

Plume Extent well 1786 had a reportable concentration of selenium that exceeded the Tier II Action Level. The selenium concentration was above both Background M2SD and Historic M2SD levels (Figure 2-61). This July selenium result is the third from three monthly samples that were discussed in the Second Quarter 2000 Groundwater Report (RMRS, 2000b). Because selenium in well 1786 exceeded its Historic M2SD in the past a suite of monthly samples has been collected and the appropriate parties have been notified of the elevated nickel. No additional metal sampling is required. Well 1786 will continue to be monitored on its routine semi-annual schedule.

Plume Extent well 23296 contained reportable concentrations of cis-1,2-dichloroethene, methylene chloride, tetrachloroethene and trichloroethene and non-reportable uranium-233/234 and uranium-238. Results for all these analytes were above Tier II Action Levels. Both uranium isotopes were below their respective Background M2SDs. No Historic M2SDs are available for well 23296 so the following observations are made by inspection. The cis-1,2-dichloroethene (Figure 2-16), tetrachloroethene (Figure 2-33) and trichloroethene (Figure 2-46) were within their normal ranges. The cis-1,2-dichloroethene rose since the suite of monthly samples collected earlier in 2000. Tetrachloroethene and trichloroethene have continued a decline that began with the second of the monthly samples. The methylene chloride has declined and was lower than the three monthly samples but still above both the Tier II and its usual range. The Third Quarter methylene chloride sample (like the preceding five samples) was tainted by blank contamination at the laboratory ("B" qualified, Figure 2-22). No additional sampling activity is required at well 23296 so routine monitoring will continue.

Plume Extent well 3586 exhibited reportable results for vinyl chloride and manganese and non-reportable uranium-233/234 and uranium-238. These results were all above their Tier II Action Levels. The vinyl chloride was well below its Historic M2SD and no further action is required (Figure 2-52). The manganese declined from the previous sampling event. It was above its Background M2SD but just below its Historic M2SD (Figure 2-53). The uranium isotopes were both well below their Background M2SDs. Routine monitoring of well 3586 will continue.

Plume Extent well 43392 had a thallium result that was not reportable but above the Tier II Action Level. The thallium was below the Background M2SD but above the Historic M2SD for the well. No action is required, routine monitoring of 43392 will continue.

Plume Extent well P314289 contains reportable nickel and non-reportable uranium-233/234 and uranium-238. These results were above their Tier II Action Levels. The uranium-233/234 and uranium-238 were both well below their Background M2SDs. Figure 2-57 shows that only four sampling events are available for metals at well P314289 (the well usually only contains enough water for VOC and nitrate samples). The Third Quarter nickel sample was the highest recorded and therefore a suite of monthly samples is required. Given enough water in the well monthly monitoring for metals at well P314289 will begin immediately, other available analytical samples will be collected on a semi-annual schedule.

RCRA Monitoring Wells: Eight RCRA monitoring wells were visited in the Third Quarter of 2000. Wells 52994 and B206989 were dry. Of the six sampled wells, one downgradient well, 4087, exhibited one reportable result. No results were over the Tier I Action Level. Two RCRA wells, 5887 and 70193, had any results that exceeded Tier II Action Levels.

Downgradient RCRA Monitoring well 4087 contained sulfate that was above the Tier II Action Level and therefore was reportable. The sulfate was above the Background M2SD and just below the Historic M2SD for the well (Figure 2-71). Although this sulfate result was the highest recorded for

15

well 4087 no monthly sampling is required at this time because the sulfate content was within its Historic M2SD. Routine monitoring of well 4087 will continue.

Downgradient RCRA Monitoring well 52894 had non-reportable uranium-233/234 and uranium-238 concentrations that were above their Tier II Action Levels. Both uranium isotopes were below their Background M2SD so no additional sampling is required. Well 52894 will be sampled routinely.

Upgradient RCRA Monitoring well 70393 contained non-reportable quantities of 1,1-dichloroethene (Figure 2-), tetrachloroethene (Figure 2-34) and trichloroethene (Figure 2-47) that were above Tier II Action Levels. The concentrations of these VOCs were below their Historic M2SDs for this well. Routine monitoring will be continued at the 70393 well site.

Upgradient RCRA Monitoring well 70493 contained a non-reportable result for uranium-233/234. This uranium isotope was above the Tier II Action Level but well below the Background M2SD. No further action is required at well 70493 so routine monitoring will continue.

Table 3-1: RFCA Groundwater Monitoring Locations and Sample Collection Summary
Third Quarter, 2000

4.0 REQUIRED ACTIONS

Plume Extent well P314289 contained reportable nickel. The nickel concentration was above the Tier II Action Level. Figure 2-57 shows the four sampling events available for nickel at the well (the well usually only contains enough water for VOC and nitrate samples). The Third Quarter nickel sample was the highest recorded and therefore a suite of monthly samples is required. Given enough water in the well, monthly monitoring for metals at well P314289 will begin immediately; if enough water is available other analytical samples will be collected on a semi-annual schedule.

Required Monthly Monitoring - **Completed**

Plume Extent well 1786 had a reportable selenium result that exceeded the Tier II Action Level. This selenium result represented the third of three monthly samples (May-June-July). These monthly results were discussed in the Second Quarter Groundwater Report (RMRS, 2000b). Well 1786 has been returned to its routine monitoring schedule.

Similarly, a chromium result collected in July from Plume Extent well 22796 was also discussed in the Second Quarter Groundwater Report (2000b). The July result was the third of three monthly samples and in this case was below the Tier II Action Level so it does not appear in Table 3-2. Well 22796 has been returned to a routine regimen of semi-annual sampling.

Downgradient RCRA Monitoring well B206989 had a reportable sulfate concentration recorded in the Second Quarter Groundwater Report (RMRS, 2000b). This caused the initiation of monthly sampling for sulfate. A sample was successfully collected in November 2000 where the sulfate result equaled 3400 mg/l. Despite multiple visits the well did not recharge and was dry in December 2000 and January 2001. Three other sulfate analyses are available; October 1992 - 2600 mg/l, January 1997 - 2760 mg/L and May 2000 - 3100 mg/l. The November sulfate analysis will be discussed in the Fourth Quarter report. Routine monitoring of well B206989 will resume.

7.0 GROUNDWATER DATA QUALITY ASSESSMENT – GENERAL INTRODUCTION

In this section, the quality of the analytical data is assessed in terms of five data-quality parameters: **precision, accuracy (bias), representativeness, completeness**, and **comparability (PARCC)** as outlined by RMRS in "**DRAFT**: Quality Assurance Program Plan For The Groundwater Monitoring Program Rocky Flats Environmental Technology Site" (RMRS, 2000a). Precision and accuracy (bias) are quantitative measures. Representativeness and comparability are qualitative measures. And completeness is a combination of both quantitative and qualitative measures. This section summarizes the types of data available to assess the PARCC parameters.

Prior to the evaluations made here the KH-ASD team performs its own data quality assessment on all Metal, Radionuclide, Volatile Organic Compound, and Water Quality Parameter results that are derived from groundwater. The nature and extent of these verification and validation activities are based upon program and customer-specified requirements and requirements of ASD to evaluate contractor laboratory performance against Statement of Work (SOW) requirements. Verification-validation criteria are generally based on government-published standards and guidelines, primarily EPA CLP and SW-846 method guidelines for organic and inorganic data evaluation and review. Verification-validation is a graded process to assess both compliance of the data package with the SOW and acceptability of the data using parameter specific guidelines. Verification is an assessment process to ensure that data meet certain specified criteria. Verification ranges from a cursory check of the data package to a more thorough review of the data up to the assignment of data qualifiers. Validation is a more thorough assessment process than verification, which usually includes examination of raw data and calculations. All laboratory generated components of the following PARCC evaluation such as matrix spikes, laboratory control samples and detection limits are considered in generating the verification and validation qualifiers. The quality of the verification-validation process should be considered to be a major influence on the quality of the PARCC assessment.

Data used to evaluate the PARCC parameters were included in the data set compiled as described in Section 2.

With respect to the 75 sites visited in the Third Quarter of 2000, samples were obtained at a maximum of 59 of the sites. Thirteen sites were totally dry. Nine sites provided only partial samples due to insufficient water. Eight of the 59 sampled sites were selected for the collection of field Real/Duplicate samples. Field Rinsate samples were also collected at seven sites. (See the discussion of Metal Representativeness below for information on two improperly collected rinsate samples from the Third Quarter.) On a per well basis overall frequency for field QC sampling is being maintained at 1 site in 20 (5%) over the course of this quarter's sampling program. Duplicates were collected at a ratio of 1 in 9.4 (10.7 %) and rinsates were collected at a ratio of 1 in 10.7 (9.3 %). Field QC data from the Third Quarter are presented below.

Precision:

The precision of a measurement is an expression of the mutual agreement between duplicate measurements of the same property taken under similar conditions. Precision can be expressed quantitatively by the relative percent difference (RPD) between real and duplicate field samples for Metals, Volatile Organic Compounds, and Water Quality Parameters as defined by the following equation:

53

$$RPD = \frac{|(S-D)|}{(S+D)/2} \times 100$$

where: S = Concentration of analyte in Real Sample
D = Concentration of analyte in Duplicate Sample

Similarly with respect to Radionuclide analyses the RFETS Groundwater Program uses the following "Duplicate Error Ratio" equation to express their precision.

$$DER = \frac{|S-D|}{\sqrt{[(TPU_S)^2 + (TPU_D)^2]}}$$

where TPU_S = Total Propagated Uncertainty of the Sample
TPU_D = Total Propagated Uncertainty of the Duplicate or Lab Replicate
S = Sample Result
D = Duplicate or Lab Replicate Result

Because TPU is seldom reported for radionuclides (except possibly for Tritium-H3 analyses) in the laboratory data records, 2-Sigma Error or random counting error has been substituted for TPU in the Uranium, Americium/Plutonium and Strontium calculations made for this report. TPU was not reported for Third quarter Tritium analyses, so 2-Sigma Error was also substituted in the DER calculation for Tritium.

Individual RPDs/DERs can be found in Table 7-1. The overall QC criterion for groundwater RPDs is ≤30%, for DERs the criterion is ≤1.96. Table 7-2 gives a summary of the Overall Precision Compliance for RPDs and DERs.

Accuracy:

Accuracy is the degree of agreement for a measurement with an accepted reference or true value and is a measure of the bias in a system. The closer the measurement to the true value, the more accurate the measurement. The validation-verification process (see above) by assigning a qualifier is the principal means for evaluating the accuracy of analytical results. For this PARCC evaluation, the accuracy assessment is based on the Procedure for Evaluation of Data For Usability (RMRS, 1998). This PARCC analysis compares the actual analytical methods used to the required analytical methods and the contract required detection limits (CRDL) for each analyte to the achieved detection limits. Table 7-3 gives the contract-required detection limits (CRDLs) for the various analytes. The Third Quarter 2000 determination of accuracy has been simplified by the presence of a complete data set derived from the SWD database. With respect to analytical results retrieved from electronic files, detection limits are readily available.

Matrix spike recoveries for metal, VOC and WQP samples (Table 7-4) and lab control sample recoveries for radionuclide samples (Table 7-5) are available for the Third Quarter. Acceptable criteria for matrix spikes and lab control samples are between 80 and 120 percent recovery. These tables give additional information on the accuracy of analyses by the laboratories.

Representativeness:

The discussion of representativeness in this section is limited to an evaluation of whether analytical results for field samples are truly representative of environmental concentrations or whether they may have been influenced by the introduction of contamination during collection and handling. The potential introduction of contamination is evaluated by examination of the analytical results for equipment rinsates (Table 7-6). Equipment rinsates are used to assess the efficacy of the decontamination process and possible cross-contamination between environmental samples. They are

samples of volatile free "distilled" water that have been poured over or through decontaminated sampling equipment and subsequently handled in the same manner as environmental samples. Although rinsates are used specifically as indicators of cross-contamination during decontamination of equipment, they are carried through the entire sampling, shipping, and laboratory process and are, consequently, also good indicators of potential contamination introduced during any of these steps. Because rinsate samples are judged to be adequate to assess introduced contamination, the groundwater program does not use trip blanks.

Other aspects of representativeness such as numbers of samples and spatial distribution are fixed in the Groundwater Integrated Monitoring Plan (DOE, 1999). As determined by the IMP, all required wells for this quarter were visited. See Figure 1 for reference to the spatial distribution of the samples.

Completeness:

A qualitative measure of completeness is the rate of successful sampling. In the Third Quarter 2000 all samples specified in the IMP were collected unless well disposition was prohibitive (i.e. the well was dry or went dry during sampling). Table 3-1 presents a summary of sample collection and well disposition.

Table 7-7 compares the Actual Number of Samples taken in the Third Quarter to the IMP driven Required Number of Samples. The completeness goal of successfully sampling 90% of the locations was not met in any of the analyte groups (see below). However, because all required wells were visited (some more than once) and all analytical results for samples from wells with enough water for the Third Quarter had been received prior to the writing of this report sampling is considered to have been successful. The data set for the Third Quarter is considered to be complete in this sense.

Completeness as a quantitative measure of data quality may be expressed as the percentage of valid or acceptable data obtained from a measurement system. In the Third Quarter 6573 analytical records were either Validated or Verified. Six $cesium_{137}$ results are not going to be validated (s.l.), another 71 plutonium, americium and uranium isotope results have been submitted for Validation (s.s.) but have not been returned. Where available, validation/verification data for each sample are listed in Appendix A. Table 7-8 summarizes the validation completeness based on the following formula:

Dp_u = Percentage of usable data points
DP_t = Total number of data points
DP_n = Non-usable data points

Completeness = $Dp_u = \frac{DP_t - DP_n}{DP_t} \times 100$ (in percent) The completeness criterion is having $\geq$ 90% valid samples.

Comparability:

Comparability is a qualitative parameter. Consistency in the acquisition, handling, and analysis of samples is necessary for comparing results. Data developed under the groundwater program are collected using RFETS SOPs, transported using both RFETS SOPs and US-DOT shipping regulations and analyzed using standard EPA or nationally recognized analytical methods to ensure comparability of results with other analyses performed in a similar manner.

55

During the Third Quarter of 2000 planned analytical methods for VOCs, WQPs, and Radionuclides remained consistent over the sampling period (see below for metals). No new analytical suites were introduced in the Third Quarter. Table 7-3 lists the required methods for the various analytes. Laboratory analyses were performed according to standard CLP protocols and results should be comparable to data produced by similar methods.

In the fourth quarter of 1998 the sampling procedure was modified in order to enhance the quality of the samples collected and also reduce the amount of purge water generated at certain wells. This practice has continued into the Third Quarter of 2000.

Some wells with adequate recharge rates had dedicated bladder pumps installed. Pump equipped wells provide an opportunity for "micropurging" at the time of sampling. Micropurging has several advantages. Micropurge sample collection provides a method of minimizing increased colloid mobilization by removing water from the well at the screen interval at a rate that preserves or minimally disrupts steady-state flow conditions in the aquifer. During micropurge sampling, groundwater is discharged from the aquifer at a rate that minimizes drawdown at the well. Research indicates that colloid mobilization will not increase above steady-state conditions during low-flow discharge. Therefore, the collected sample is more likely to represent insitu groundwater chemistry. In addition, less water is needed to purge the pump system compared to purging the entire well with a bailer. Thus there is less purge water to dispose of.

The installation of bladder pumps and micropurging without sample filtration resulted in a change in analytical method for metals. Pump equipped wells are sampled and analyzed for total metals because no filter is used during sample collection. Bailed well samples are filtered and analyzed for dissolved metals.

DISCUSSION OF ANALYTE GROUPS

7.1 METALS

Precision:

There were 216 records for duplicate samples versus 1464 real sample records in the data set for metals in the Third Quarter, 2000 (1 in 6.7, 14.7 %). The number of duplicate samples collected in the Quarter was adequate for data quality objectives. From the 216-real/duplicate pairs there were 143 records in which a Relative Percent Difference (RPD) could be calculated and displayed in Table 7-1 (see Table 7-2 for information on which RPDs were calculated). Of the 143 metal RPDs in Table 7-1, 114 were within the QC criterion of $\leq$30% for groundwater as summarized in Table 7-2 and twenty-nine were outside the criterion. Overall 187 of 216 (86.6 %) of the metal RPDs meet the QC criterion. Based on the Relative Percent Difference calculations overall precision for dissolved metal analysis is adequate (>85%) for the Third Quarter 2000.

The RPD results that do not meet the QC criterion are distributed in the following manner (number of occurrences in parentheses); aluminum (5), cadmium (3), iron (3), manganese (3), chromium (2), cobalt (2), molybdenum (2), zinc (2), arsenic (1), beryllium (1), copper (1), potassium (1), selenium (1), sodium (1) and vanadium (1). No metal or group of metal analytes appear to dominate those that exceeded the 30% QC criterion.

Of the 29 RPD pairs not meeting the precision criterion, 12 pairs had results that were less than 1.5 µg/l. Generally the precision of analyses of low concentrations are limited by such considerations as

56

matrix variability or instrument stability reflected in the detection limits. All of these same results were also "U" or "B" qualified by the laboratory meaning they were non-detections or the result was above the instrument detection limit but below the CRDL, again indicating that small quantities of metal are being considered. Similarly, many of the results were validated with "J/J1" or "UJ/UJ1" qualifiers indicating that the results are non-detections or estimates in some way. Fifteen of the remaining 17 RPD results are from metals that are not contaminants of concern (aluminum, copper, iron, manganese, potassium, sodium, and zinc).

The recommended frequency for duplicate samples is 1 in 20 (5 %) on a per sample basis (see above). In the Third Quarter, 8 of 75 of all wells visited were analyzed for metals as Real/Duplicate pairs, a ratio of 1 in 9.4 (10.7 %). Thus the Duplicate sampling frequency was within the requirements for the Third Quarter on both a per well and per sample basis.

Accuracy:

Contract-required-detection limits (CRDLs) for total and dissolved metals were not met in the following cases.

General Engineering Laboratory (GEL)
Wells: 00597, 1386, 43392, 52894, 5887, 70393

Analyte	Actual Detection Limit	Required Detection Limit		Number of records	Tier II
Antimony	2.24 µg/l	1.0 µg/l	1	6 µg/l	
Antimony	1.61 µg/l	1.0 µg/l	5		
Arsenic	2.46 µg/l	1.0 µg/l	1	50 µg/l	
Arsenic	2.92 µg/l	1.0 µg/l	5		
Cadmium	0.361µg/l	0.3 µg/l	1	5 µg/l	
Cadmium	0.686µg/l	0.3 µg/l	5		
Lead	2.25 µg/l	1.0 µg/l	1	15 µg/l	
Lead	1.38 µg/l	1.0 µg/l	5		
Selenium	2.37 µg/l	1.0 µg/l	1	50 µg/l	
Selenium	2.14 µg/l	1.0 µg/l	5		
Silver	0.618 µg/l	0.1 µg/l	1	183 µg/l	
Silver	0.935 µg/l	0.1 µg/l	5		
Thallium	3.26 µg/l	0.5 µg/l	1	2 µg/l	
Thallium	2.11 µg/l	0.5 µg/l	5		

RECRA Environmental Inc. (RECRL)
Wells: All other wells not listed with GEL above.

Analyte	Actual Detection Limit	Required Detection Limit	Number of records	Tier II
Selenium	1.1 µg/l	1.0 µg/l	71	50 µg/l
Silver	0.28 µg/l	0.1 µg/l	71	183 µg/l
Thallium	0.9 µg/l	0.5 µg/l	71	2 µg/l

Of the 255 analyses listed above, 206 were "U" qualified as non-detections by the laboratories and another 19 were "B" qualified as above the instrument detection limit but below the contract required detection limit. There were 30 detections. Within the 30 detections selenium at locations 0487, 10992, 10994, 1786, 6286 and 891COLWEL and thallium at 43392 appear in Table 3-2 as having

results exceeding the Tier II Action Level. The results for these metals in these wells appear to be within the normal concentrations for the wells as illustrated by the Trend plots shown in Section 6.

Five of the 255 results were rejected in the validation (s.l.) process for having either a calibration blank exceed the required detection limit, an instrument with an out of date instrument detection limit or a low level check sample recovery criteria that was not met. The rejected results, from GEL, include antimony (2) and selenium (3). Rejected results do not appear in Table 3-2 they are included with the data in the appendices. The remaining 250 validation qualifiers were distributed in the following manner; V/V1 (177), J/J1 (57), UJ (1) and there were 15 dilution results that were not validated because the first analysis already had been evaluated. The validation results for these metals show that the accuracy was not seriously affected by missed detection limits.

The inability of the two laboratories to meet detection limits in the cases mentioned above has not caused serious analytical problems. Except possibly for thallium the actual detection limits are close enough to the required detection limits so that given the Tier II Action Levels that no Tier II exceedances were missed. The Analytical Services Division is aware of the detection limit problem and is in communication with the laboratories.

All metal analyses were performed using the proper contract required methods listed in Table 7-3 in the Third Quarter of 2000. With respect to methods the results for the Third Quarter in general are accurate.

Table 7-4 gives matrix spike recoveries for metals based on the electronic information submitted with RINs collected in the Third Quarter. The results in Table 7-4 show that 271 of 283 (95.8 %) metal matrix spikes were within the matrix spike criterion of 80-120 %. The failed matrix spikes included 4 lithium and one each for cadmium, cobalt, iron, nickel, strontium, thallium and zinc (RECRL) and an additional lone sodium (GEL). Matrix spike accuracy for metals was acceptable in the Third Quarter.

Representativeness:

As mentioned in the general discussion above representativeness is an evaluation of the sampling procedure for its ability to reflect the true groundwater concentrations of contaminants. Rinsate samples are used by the Groundwater Program to determine whether there is introduced contamination from the sampling process. In evaluation of the Third Quarter 2000 rinsate results it was discovered that two rinsate samples collected in conjunction with real-duplicate pairs at locations 891COLWEL and 891COLGAL consisted of well water and not rinsate. Comparison of the Real, Duplicate, and Rinsate results for metals (and also VOCs and Uranium-isotopes, see Appendices) indicated that the three sets of results are similar. Investigation by the Groundwater Program staff was not able to determine how well water was used to fill sample bottles that should have contained rinse water. The sampling crews have been informed of the situation, reread the Sag SOPs for sampling and taken an exam based on those SOPs. The crews have been told that more care is to be exercised in gathering rinse samples in the future and have promised to do so. (Note that results for metal rinsates from 891COLWEL and 891COLGAL are not included in the statistics cited below although the data is included in Table 7-6.)

There were 135 rinsate records versus 1761 real and duplicate sample records for metals from the Third Quarter 2000. That is a ratio of 1 in 13.0 which is still within the criteria of 1 in 20 on a per record basis in spite of the absence of data from the two "891" locations. Of the 135 rinsate records all save one aluminum record were lab qualified as either "U" (non-detection-77, 57%) or "B"

58

(detection was less than Contract Required Detection Limit but greater than Instrument Detection Limit-58, 43%). The lone aluminum detection (17.4 μg/L) was not above the Tier II Action Level. This indicates that with respect to rinsates collected at other locations than the "891s" no metal contamination was introduced during sampling and/or shipping activities. With the absence of contamination introduced during the sampling process the metal analyses for the Third Quarter are judged to be representative of the actual well water concentrations.

Because all required sampling locations defined in the IMP were visited and all samples that could be collected were analyzed, metal analyses for the Third Quarter 2000 are judged to be representative with respect to spatial coverage.

Completeness:

Table 7-7 indicates that 64 wells were to have been sampled for metals in the Third Quarter 2000. Ten dry wells or wells that went dry during sampling resulted in the collection of 54 actual samples, a success ratio of 84.4 %. The goal, groundwater conditions permitting, is to have greater or equal to 90% successful sampling.

Validation/Verification completeness is summarized in Table 7-8. The validation process is complete with respect to metals all results were verified or validated (100%). Of the 1869 real, duplicate and rinse metal analyses that were validated or verified in the Third Quarter 99.2 % of the analyses are usable. A total of fourteen metal analyses were rejected. Five rejected records were mentioned above (see Accuracy). Similarly, the other nine analyses, mercury (6) and zinc (3), were rejected for having either a calibration blank exceed the required detection limit, an instrument with an out of date instrument detection limit or a low level check sample recovery criteria that was not met. With 99 % of metal analyses for the Third Quarter providing usable data, metal analyses are considered to be complete with respect to validation and verification.

Comparability:

As stated in Section 2 no changes were made to analytical procedures in the Third Quarter of 2000. Thus analyses from the Third Quarter are assumed to be comparable to previous analyses.

7.2 RADIONUCLIDES

Precision:

There were 41 duplicate records versus 244 real records (1 in 6.0, 16.8 %) collected in the Third Quarter 2000. Duplicate samples were collected for plutonium/americium, uranium isotopes, tritium, strontium and cesium. A Duplicate Error Ratio (DER) could be calculated and displayed in Table 7-1 for 13 of the 41 paired real to duplicate records (see Table 7-2 for display criteria). All 13 DER values (100%) are below the 1.96 criterion (Table 7-2). The goal for DER values is to have 85% compliance. Precision with respect to being able to generate repeatable results for Third Quarter radionuclide data is considered to be adequate.

Accuracy:

Required detection limits for the 320 real, duplicate and rinse radionuclide analyses performed in the Third Quarter 2000 are given in Table 7-3. All radionuclide analyses performed in the Third Quarter

59

met the contract required detection limits. Radionuclide results are considered accurate with respect to detection limits for the Third Quarter 2000.

All radionuclide analyses were performed using the proper contract required test methods in the Third Quarter of 2000 (Table 7-3). With respect to methods the results for the Third Quarter are accurate.

Table 7-5 gives the Laboratory Control Sample (LCS) Recoveries for radionuclides collected in the Third Quarter. For the 66 records in Table 7-5 there are 27 (41 %) that the laboratories reported correctly as a percent recovery. All of these records are within the 80-120 % acceptable criterion. Accuracy with respect to these correctly reported LCS Recoveries is good.

The laboratories have been notified by KH-ASD to report their LCS results in terms of percent recoveries but have not fully implemented the correction. It does appear that data from RINs submitted to the labs later in the Quarter are more compliant than earlier data. Note that the GEL laboratory does not spike their LCS samples for uranium-233/234 and uranium-235 but does spike for uranium-238 in their analytical procedure.

Representativeness:

There were 29 records from 6 rinsate locations for radionuclides collected in the Third Quarter (Table 7-6). This does not count 6 rinsate records from locations 891COLWEL and 891COLGAL that have been omitted for reasons mentioned in the discussion of metal Representativeness above. The 29 records give a ratio of 1 in 9.8 with respect to the 285 records for real-duplicate analyses and 1 in 8.5 with respect to the 51 wells sampled. The adjusted number of rinsates is adequate to fulfill the 1 in 20 criterion per record and per well for the Third Quarter.

All 29 rinsate analyses were below Tier II Action Levels and all but two analyses were designated as "U" (non-detects) by the laboratories. The two analyses listed as detections are well below their Tier II Action Levels. The strontium-90 result of the pair has a reported value of 0.094 pCi/L and a detection limit of 0.363 pCi/L. Listing this result without qualifying it as a "U" appears to be incorrect. Twenty-five radionuclide rinsate results were verified or validated and all of these results are usable data points. Three uranium results are still in the validation process. A single cesium rinsate analysis will not be validated because the analysis is done by special task order at this time. There is little indication of introduced radionuclide contamination during sampling activities in the Third Quarter of 2000. Radionuclide results for the Third Quarter are judged to be representative of environmental concentrations.

Because all required sampling locations were visited and those samples that could be collected were analyzed and none were lost, destroyed in transit or failed validation radionuclide analyses for the Third Quarter 2000 are judged to be representative with respect to spatial coverage.

Completeness:

Table 7-7 indicates that the success ratio for radionuclide sample collection varied widely due to dry wells or wells that went dry during sampling. All wells that required radionuclide sampling were visited at least once in the Third Quarter. The success ratios for the various radionuclide analytes were 72.7% for plutonium/americium, 79.7%-uranium isotopes, 76.5%-tritium, 55.6%-strontium$_{89/90}$ and 66.7% for cesium$_{137}$. The completeness goal of 90% was not met for any of the radionuclides sampled in the Third Quarter.

60

Three hundred fourteen of 320 radionuclide results have been validated and provide usable data points (Table 7-8). Cesium$_{137}$ analyses are done as a special order and do not get validated. The six results that are not validated are for cesium$_{137}$. Radionuclide analytical data are judged to be complete with respect to validation and verification for the Third Quarter 2000.

Comparability:

No changes were made to analytical procedures in the Third Quarter of 2000. Thus the radionuclide analyses presented here are assumed to be comparable to previous analyses.

7.3 VOLATILE ORGANIC COMPOUNDS

Precision:

There were 465 duplicate records versus 3422 real records for volatile organic compounds in the Third Quarter (1 in 7.4 samples, 13.6 %). Of the 465 real/duplicate pairs a relative percent difference (RPD) could be calculated and displayed in Table 7-1 for 31 pairs (see Table 7-2 for display criteria). Six of the 31 RPDs in Table 7-1 were outside the +/-30% criterion. Five of the six RPD values that do not meet the criterion may be flawed.

The RPD calculation from well 12691 compares a real analysis run with a 1x dilution and a duplicate run with a 20x dilution. Thus the duplicate result for 1,1-DCE in the well tries to calculate the RPD with a "U" detection limit/result of 20 μg/L. The RPD derived from this calculation should be considered invalid. Again with respect to well 12691 the methylene chloride results for both real and duplicate are influenced by lab contamination of blanks ("B" qualifiers) and therefore these RPDs should be considered dubious. Similarly, for well P209389 the duplicate analysis for methylene chloride was "B" qualified and therefore its associated RPD should be discounted. The carbon tetrachloride (TR2/TR2) and tetrachloroethene (TR2/TR2) RPDs from well P209389 are based on dilutions with low reported values. Because the dilution process might have compromised the reported values these RPDs may be invalid. Note that for the "TR1/TR1" carbon tetrachloride and tetrachloroethene from P209389 RPDs for the undiluted samples are shown and they show perfect agreement (= 0)for their RPDs.

The Relative Percent Difference goal is to have 85% of the RPDs within +/-30 %. If the 25 RPDs meeting the criteria in Table 7-1 are compared the total 31 RPDs that gives a success ratio of 80.6% which is not acceptable. If the five RPD values discussed above are discounted then there are 24 values in 25 calculations that meet the criterion an acceptable success ratio of 96.0 %. Considering all 465 real-duplicate records, including those not appearing in Table 7-1 where both results are non-detections (implying that the RPD would equal zero for similar dilutions), 459 or 98.7 % could meet the acceptable criterion. In general VOC analyses for the Third Quarter of 2000 are judged to be reproducible and may therefore be considered to be precise.

Accuracy:

Required detection limits for VOC analyses are given in Table 7-3. The Contract Required Detection Limits (CRDLs) were met in the Third Quarter except in the following cases. In these cases where a whole RIN is cited the detection limit reported by the laboratory causes all contract required detection limits to be exceeded for that analytical run.

61

VOCs by EPA 524.2 Method (all compounds have a 1 µg/l CRDL and were analyzed by RECRL)

Well 90099 (Real-TR1) RIN 00D1370 run at 50x dilution, detection limit 50 µg/l, 57-results
Well 90399 (Real-TR1) RIN 00D1370 run at 20x dilution, detection limit 20 µg/l, 57-results
Well 95199 (Real-TR1) RIN 00D1370 run at 5x dilution, detection limit 5 µg/l, 57-results
Well 23296 (Real-TR1) RIN 00D1370 run at 20x dilution, detection limit 20 µg/l, 57-results
Well 0487 (Real-TR1) RIN 00D1385 run at 5x dilution, detection limit 5 µg/l, 57-results
Well 00491 (Real-TR1) RIN 00D1385 run at 10x dilution, detection limit 10 µg/l, 57-results
Well 12691 (Dup-TR1) RIN 00D1394 run at 20x dilution, detection limit 20 µg/l, 57-results
Well 12691 (Dup-DL1) RIN 00D1394 run at 50x dilution, detection limit 50 µg/l, 57-results
Well 22896 (Real-TR1) RIN 00D1410 run at 50x dilution, detection limit 50 µg/l, 57-results
Well 22896 (Real-TR2) RIN 00D1410 run at 200x dilution, detection limit 200 µg/l, 57-results
Well 07391 (Real-TR1) RIN 00D1410 run at 5000x dilution, detection limit 5000 µg/l, 57-results
Well 15699 (Real-TR1) RIN 00D1410 run at 100x dilution, detection limit 100 µg/l, 57-results
Well 891COLWEL (Real-TR1) RIN 00D1456 run at 20x dilution, detection limit 20 µg/l, 57-results
Well 891COLWEL (Dup-TR1) RIN 00D1456 run at 20x dilution, detection limit 20 µg/l, 57-results
Well 891COLWEL (Rinse-TR1) RIN 00D1456 run at 20x dilution, detection limit 20 µg/l, 57-results

In total there were 59 VOC samples submitted for analysis in the Third Quarter resulting in 4293 records being returned (not counting records relating to dilutions). The 856 records in the list above represent 12 samples in which the 1 µg/l CRDL was not met for a particular location. Therefore, 47 samples and 3437 records (80 %) met the detection limits. The accuracy of VOC analyses with respect to detection limits is barely adequate for the Third Quarter 2000. It may be difficult to increase the number of samples that meet the accuracy requirements for detection limits for the following reason.

All the sampling locations in the group above contain some amount of contamination. Analysis at a 1x dilution may be impossible for some locations if the laboratory wants to protect their instruments from damage due to high concentrations of contaminants. The KH-ASD team is working with the laboratories to try and get them to meet the 1-µg/l detection limit while preventing the excessive dilution of the samples.

Table 7-4 gives the Third Quarter VOC matrix spike results. The GEL laboratory procedure is to prepare and calculate results for matrix spikes in only six compounds. Therefore, for GEL only those six compounds appear with percent recoveries in the matrix spike Table 7-4.

The acceptable matrix spike criterion is to have the recovery be between 80% and 120% (inclusive). With respect to matrix spikes for VOCs, 29 entries out of 484 (6 %) were outside the range of 80-120 %, 455 entries were within the criterion (94.0 %). Thirteen of the 29 VOC matrix spikes that did not meet the criteria were one of a pair of matrix spike results (usually a matrix spike duplicate) in which the other member of the pair did met the QC criterion. In eight cases both members failed to meet the criterion. The eight-paired failures are a problem in RINs 00D1385, 00D1410 and 00D1456 because this may indicate matrix interference is affecting analyses for the contaminants of concern, methylene chloride, trichloroethene and carbon tetrachloride. The validation/verification values assigned to these compounds in these RINs should reflect consideration of the matrix spike results. None of the related results for these three compounds were rejected. Given that 94 % of the matrix spike results are within the QA criterion accuracy is acceptable for VOCs in the Third Quarter 2000.

62

All VOC analyses were performed using the proper contract required methods in the Third Quarter of 2000 (Table 7-3). With respect to methods the results for the Third Quarter are accurate.

Representativeness:

There were 348 rinsate records from six wells (6 of 69 equals 1 in 9.8, 10.2 %) for Volatile Organic Compounds for the Third Quarter of 2000 (Table 7-6). This does not count the 116 rinsate records from locations 891COLWEL and 891COLGAL that have been omitted for the reasons mentioned in the discussion of metal Representativeness above. The rinse results for 891COLGAL do appear to be those indicative of a rinse sample but because of the obvious error in substituting well water for rinsate in the metal and uranium isotope samples they are not being counted here. The total VOC rinsate count does include 58 rinsate results from well 01097 which while not a "Program" well was sampled and submitted to the laboratory with other program wells. The 348 records represent a ratio of 1 in 11.2 (9.0%) with respect to the 3887 real and duplicate analyses. The number of rinses taken in the Third Quarter is greater than the 1 in 20 (5%) requirement on a per record and per well basis.

All rinsate analyses were at or below detection limits and were lab qualified as non-detects ("U") except in four cases. The four extra results were for methylene chloride. These were "JB" qualified by the laboratories indicating that the result is an estimate with the analyte being present in the associated method blank. These results were for small amounts (≤ 1 µg/L). All rinsate result values were below the Tier II Action Levels. The VOC samples are judged to be representative of environmental conditions indicating no introduced contamination due to sampling.

Because all required sampling locations were visited and those samples that could be collected were analyzed and none were lost, destroyed in transit or failed validation VOC analyses for the Third Quarter 2000 are judged to be representative with respect to spatial coverage.

Completeness:

Table 7-7 shows that 72 wells were to have been sampled for VOCs within the Third Quarter 2000. Because of the dry conditions only 59 VOC samples could actually be collected. That translates to a success ratio of 81.9 % for VOCs. This is below the goal of collecting 90 % of the required samples. Nevertheless sampling for VOCs in the Third Quarter is judged to be complete because all wells were visited as specified by the IMP.

All VOC and samples collected in the Third Quarter of 2000 were validated (s.l.) on the assumption that the holding time for unpreserved VOC vials is 7 days. The RFETS groundwater program uses a 14-day hold time based on recent CDPHE guidance (CDPHE, 1998). Because of the 7-day hold time criteria, sample results may have received an erroneous "J" or "J1"validation qualifier if no other factors affected the analyses.

All VOC samples for the Third Quarter of 2000 were validated or verified (Table 7-8). VOC results for all 4293 records are useable (100%). From the standpoint of validation/verification as it pertains to completeness of the data set, Third Quarter VOC results are complete.

Comparability:

As stated above no changes were made to analytical procedures in the Third Quarter of 2000. Thus the VOC analyses presented here are assumed to be comparable to previous analyses.

7.4 WATER QUALITY PARAMETERS

Precision:

There were 17 duplicate sample records versus 132 real sample records for Water Quality Parameters (WQPs) during the Third Quarter (1 in 7.8, 12.8 %). Of the 17 real-duplicate pairs, 15 could be used to generate Relative Percent Difference (RPD) values and these are displayed Table 7-1 (see Table 7-2 for the display criteria). All 17 real-duplicate RPD pairs were within the QC criterion of ≤30% (Table 7-2). The RPD calculations presented here indicate that WQP analyses were reproducible and therefore in the Third Quarter precision is good.

Accuracy:

Electronic data indicate that the contract required detection limits were met for all WQP analyses (Table 7-3). Thus results for the Third Quarter should be accurate within the limits imposed by the detection limits.

All WQP analyses were performed using the proper contract required methods in the Third Quarter of 2000 (Table 7-3). With respect to methods the results for the Third Quarter are accurate.

Table 7-4 gives the matrix spike results for WQPs for the Third Quarter 0f 2000. The KH-ASD team has informed Acculab that they have been delinquent in submitting the actual bottle number used to prepare the matrix spike. With this information we can better track the source well.

Twenty-nine of 31 matrix spikes shown in the table are within the acceptable 80-120% recovery range (93.5%). The two failing nitrate matrix spikes have the same laboratory sample and batch numbers indicating they are from one analysis that applies to two different RINs. In the case of RIN 00D1514 a second acceptable matrix spike result is available. Interpretation of the matrix spike results suggests that analyses for Water Quality Parameters in the Third Quarter 2000 should be accurate.

Representativeness:

There were 13 equipment rinsate results from four different wells for water quality parameters in the Third Quarter (Table 7-6). This represents a ratio of 1 in 11.5 (8.7 %) with respect to the 149 real-duplicate analytical records. With respect to wells, rinsates were collected at 1 in 14.2 (7.0 %) locations. The sampling frequency for rinsates on a per record and per well basis is adequate.

Because no rinsates for water quality parameters were collected at locations 891COLWEL and 891COLGAL the error in collecting rinsate samples at those locations may be discounted.

Nine of the 13-rinsate analyses were classified as non-detections ("U") by the laboratories (69.3 %). These analyses indicate that there was no introduced contamination. The four remaining total dissolved solid rinsates were classified as detections. However, total dissolved solids do not have a Tier II Action Level and these four results are the lowest results by a factor of from four to 10 collected for the quarter. These four analyses also indicate not introduced contamination. All the WQP rinsates were qualified as "V" or "V1" in validation. Third Quarter Water Quality Parameters are representative of environmental conditions, no introduction of contaminants due to the sampling process is indicated.

Because all required sampling locations were visited and those samples that could be collected were analyzed and none were lost, destroyed in transit or failed validation WQP analyses for the Third Quarter 2000 are judged to be representative with respect to spatial coverage.

Completeness:

Table 7-7 indicates that for Water Quality Parameters sampling completeness was highly variable due to the availability of water at the wells. Success ranged from 82.5% for nitrates to 50 % for cyanide. However, Table 7-7 also shows that all wells requiring WQP samples were visited during the quarter. Because all wells were visited and all samples were collected when water was available, Water Quality Parameter sampling for the Third Quarter is judged to be complete.

All of the Water Quality Parameter samples collected this quarter (100%) gave usable results with respect to validation/verification (Table7-8). Therefore, the water-quality-parameter data set is complete for the Third Quarter 2000.

Comparability:

As stated above no changes were made to analytical procedures in the Third Quarter of 2000. Thus the WQP analyses presented here are comparable to previous analyses.

65

Table 7-1
Relative Percent Difference (RPD) and Duplicate Error Ratio (DER) for Groundwater
Third Quarter, 2000

Table 7-2
Summary of RPD and DER Results
Groundwater - Third Quarter, 2000

Analyte Group	QC Criterion for Acceptable RPD or DER Value	Original Number of Available Real/Dup Pairs	Number of RPDs/DERs Calculated	Number of Acceptable RPDs/DERs Calculations	Overall Precision Compliance (Goal = 85%)
Radionuclides	less than 1.96	41	13	13	100%
Organic Compounds	less than 30%	580	30	24	80%
Metals	less than 30%	216	143	114	80%
Water Quality Parameters	less than 30%	17	15	15	100%

Based on 854 original Real-Duplicate pairs.
With respect to VOCs: Wells 12691 and P209389 have RPD-values for Real to Duplicate results for a TR1/TR1 pair and a second value for a TR2/TR2 pair. In the past these extra RPD values have not been included in the total given above.

Calculation Criteria	Lab Qualifier = "U"		Lab Qualifier = "B"		Lab Qualifier = "J"	
	Meaning	Action	Meaning	Action	Meaning	Action
Radionuclides	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Activity in the method blank exceeded the minimal detectable activity (MDA).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.
Organics	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Analyte in both sample and associated method blank.	Calculation made.	Result is estimate.	Calculation not made for "J" or "JB" data when result is less than CRDL.
Metals	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Result detected was less than contract required detection limit (CRDL) but greater than the instrument detection limit (IDL).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.
Water Quality Parameters	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Result detected was less than contract required detection limit (CRDL) but greater than the instrument detection limit (IDL).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.

Table 7-7
RFCA Groundwater Monitoring Sample Comparison:
Required versus Actual Third Quarter, 2000

Sample Types		Required Number of Visits	Actual Number of Visits*	Actual Number of Samples Collected	Deviation	Success Ratio; % Samples Collected (or Wells Visited)	Discrepancy Justification
Groundwater Wells (Visits)		75	75	NA	0	100.0	
VOC's		72	72	59	13	81.9	Dry
Metals		64	64	54	10	84.4	Dry or Insw
Radionuclides							
	Pu/Am	44	44	32	12	72.7	Dry or Insw
	U-isotope	64	64	51	13	79.7	Dry or Insw
	Tritium	17	17	13	4	76.5	Dry
	Strontium	9	9	5	4	55.6	Dry or Insw
	Cesium-137	6	6	4	2	66.7	Insw
Water Quality Parameters							
	Cyanide	6	6	3	3	50.0	Insw
	Fluoride	17	17	13	4	76.5	Dry
	Nitrate	57	57	47	10	82.5	Dry or Insw
	Sulfate	32	32	23	9	71.9	Dry
	TDS	58	58	45	13	77.6	Dry or Insw
Totals		446	446	349	97	78.3	Dry or Insw

*Does not reflect multiple visits to dry wells.
Dry = Well did not recharge after purging. No samples collected.
Insw = Insufficient water to complete sample suite.

103

Table 7-8
Summary of Validation / Verification Completeness
Groundwater - Third Quarter, 2000

		Usable Data Points - Dp_u	Non-usable Data Points - DP_n	Total Data Points - DP_t	Percent of Usable Data Points	No Validation Verification
VOC's		4293	0	4293	100.0%	0
Metals		1855	14	1869	99.3%	0
Radionuclides						
	Pu / Am	85	0	85	100.0%	0
	U-isotope	198	0	198	100.0%	0
	Tritium	18	0	18	100.0%	0
	Strontium	13	0	13	100.0%	0
	Cesium		See	Below		6 (None)
Water Quality Parameters						
	Cyanide	5	0	5	100.0%	0
	Fluoride	18	0	18	100.0%	0
	Nitrate	57	0	57	100.0%	0
	Sulfate	28	0	28	100.0%	0
	TDS	54	0	54	100.0%	0
Totals		6624	14	6638	99.8%	6

Usable data points include the following Validation/Verification qualifiers: J/J1, JB/JB1, U/U1, UJ/UJ1, NJ/NJ1, V/V1.
Non-usable data points include the following Validation/Verification qualifiers: R/R1.

Because Cesium and Methane analyses are set up via special contracts they are not being validated at this time.

With respect to TR1-DL1 or TR1-TR2 analytical series, only one Result from a pair (with a validation qualifier) is counted here.

$$\text{Completeness} = \frac{Dp_u = DP_t - DP_n}{DP_t} \times 100 \text{ (in percent)}$$

The acceptable QC criterion is **>90%.**

104

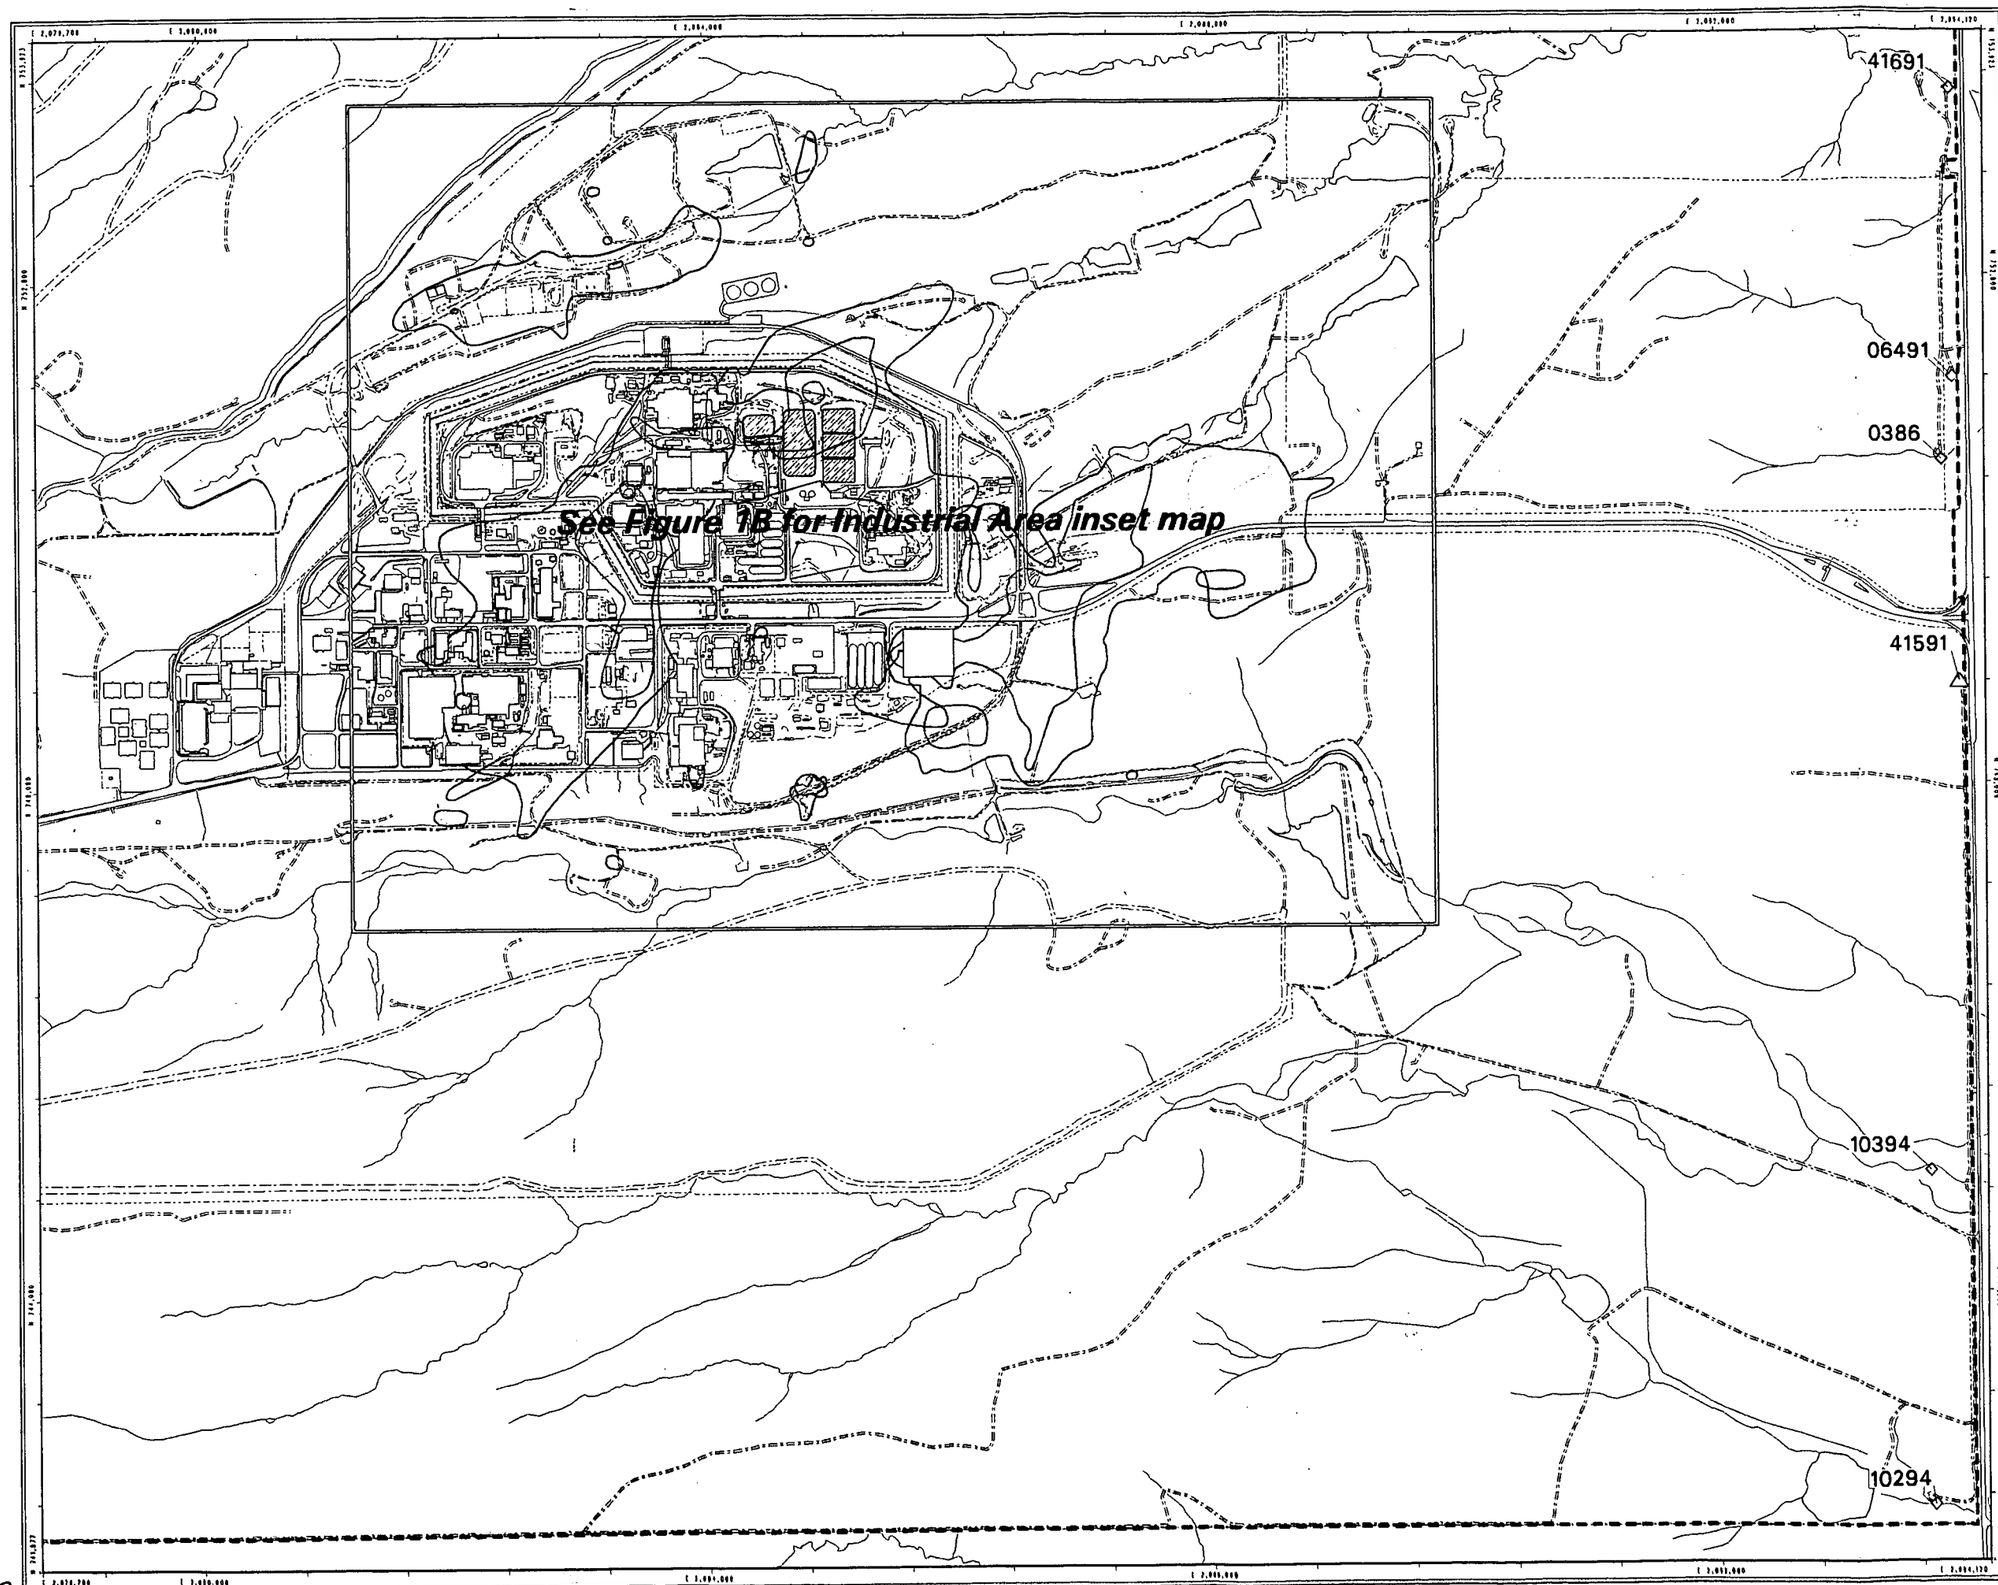

Figure 1A

Regulatory Required Buffer Zone Groundwater Monitoring Wells

Selected VOC & Nitrate Plumes Third Quarter, 2000 Reportable Sample Analyses

EXPLANATION

- ● IMP Wells Not Sampled This Quarter
- ◇ IMP Wells Sampled/Visited This Quarter
- △ IMP Wells With Reportable Tier II Sample Analyses
- Composite VOC Groundwater Plume (100 X MCL)
- Composite VOC Groundwater Plume (concentration equal to MCL)
- 100 x Nitrate Standard (1000 mg/l)
- Nitrate Standard (10 mg/l)

Standard Map Features

- Buildings and other structures
- Solar Evaporation Ponds (SEP)
- Lakes and ponds
- Streams, ditches, or other drainage features
- Fences and other barriers
- Rocky Flats boundary
- Paved roads
- Dirt roads

DATA SOURCE BASE FEATURES:
Buildings, fences, hydrography, roads and other structures from 1994 aerial fly-over data captured by EG&G RSL, Las Vegas. Digitized from the orthophotographs. 1/95

Scale = 1 : 14310
1 inch represents approximately 1193 feet

250 0 500 1000ft

State Plane Coordinate Projection
Colorado Central Zone
Datum: NAD27

U.S. Department of Energy
Rocky Flats Environmental Technology Site
