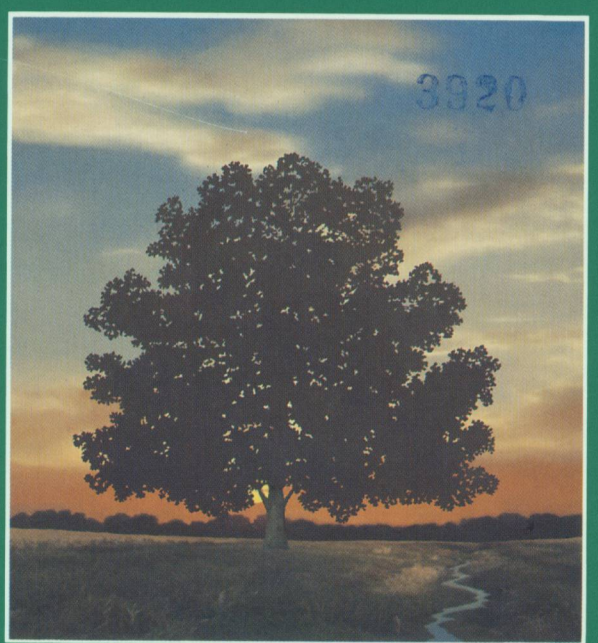
FERNALD ENVIRONMENTAL MANAGEMENT PROJECT

Environmental Quality Policy



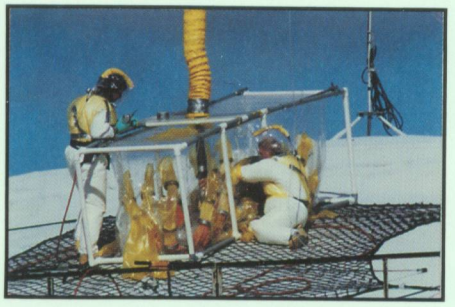
FERNALD ENVIRONMENTAL MANAGEMENT PROJECT

The U.S. Department of Energy is committed to ensuring that all activities at the Fernald Environmental Management Project are conducted in compliance with applicable environmental laws and regulations which provide for the protection of the environment, the general public, and employees. To further reinforce our commitment, we will strive to:

- Continually assess and improve environmental programs and procedures as part of an effort to achieve accelerated site cleanup in a safe, high quality, and cost efficient manner.

- Work in concert with state and federal regulators to pursue the safe, permanent disposition of all radioactive and hazardous waste materials, and the safe transfer of reusable product to other DOE or commercial facilities.

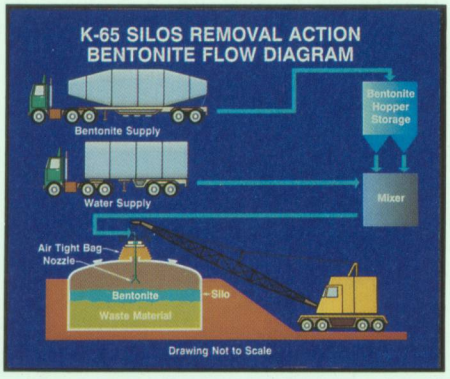
- Evaluate and continually improve radiological and occupational health and safety performance, to ensure that appropriate programs are developed and implemented effectively at Fernald.

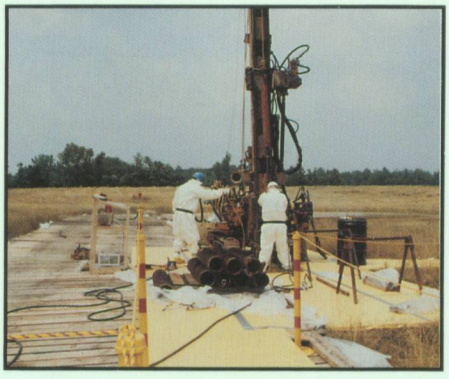


- Actively recruit personnel with expertise in environmental and other technical areas to maintain a continuing emphasis on environmental compliance and cleanup in a cost efficient manner.

Environmental Quality Policy

- Develop better, faster, safer, and less expensive technologies that can be used at the Fernald Environmental Management Project and at other cleanup sites across the country.





- Use the most qualified contractor resources and the best available technologies to accelerate cleanup activities on near-term concerns while working towards effective, complete long-term cleanup plans at the Fernald Environmental Management Project and surrounding facilities.

- Educate employees and the public on waste minimization techniques that are useful both at work and in the home, as part of a continuing commitment to recycling.

- Maintain open, honest communication with the public, regulators, and local governments, and keep them informed of environmental cleanup, waste management, technology development, and restoration engineering activities at the Fernald Environmental Management Project.

The U. S. Department of Energy is committed to ultimate restoration at the Fernald Environmental Management Project. To the benefit of all, the lessons learned at Fernald will raise the environmental consciousness of future generations.
