Mr. Tom Schneider, Project Manager
Ohio Environmental Protection Agency
401 East 5th Street
Dayton, Ohio 45402-2911

Dear Mr. Saric and Mr. Schneider:

TRANSMITTAL OF THE REVISED AREA 1, PHASE I CERTIFICATION REPORT

The purpose of this letter is to transmit, for your review and approval, the Revised Area 1, Phase I Certification Report. This report incorporates the responses to the U.S. Environmental Protection Agency (U.S. EPA) and Ohio Environmental Protection Agency (OEPA) comments on the Area 1, Phase I Certification Report. The draft responses to comments were submitted to the U.S. EPA and OEPA on April 27, 1998. This report also includes three attachments: Attachment A) Certified and Characterized for Reuse Areas, May 28, 1998; Attachment B) Final Response to the U.S. EPA and OEPA Comments on the Area 1, Phase I Certification Report; and Attachment C) Memorandums concerning Technetium-99 volatility.

The enclosed report represents the compilation of the certification sampling and analysis data from the identified certification units within Area 1, Phase I, including the On-Site Disposal Facility (OSDF) Support Areas. The two remaining portions of the north access road within Area 1, Phase I have not been included in this report because these areas can not be certified until the areas have been excavated to the required certification depth.

If you have any questions, please contact Robert J. Janke at (513) 648-3124.

Sincerely,

Johnny Reising

EXECUTIVE SUMMARY

This Certification Report presents the process and results for certification of soils within Area 1 Phase I (A1PI) at the Fernald Environmental Management Project (FEMP). However, the A1PI project and all associated draft documents were developed and submitted to the regulatory agencies in late 1996 and early 1997, prior to the development of the Sitewide Excavation Plan (SEP). The methods used for A1PI and discussed in this report apply to A1PI only. The methods to be utilized for all other soil projects are defined in the SEP.

The A1PI soil remediation project complies with requirements of the Operable Unit 5 (OU5) Record of Decision (ROD), which established a Department of Energy (DOE) commitment to execute remedial actions to excavate contaminated soil that exceed the health-based final remediation levels (FRLs). A1PI consists of 123 acres in the northeast corner of the site and includes the footprint of the two initial On-Site Disposal Facility (OSDF) cells, a portion of the existing North Access Road (NAR), 63 acres of open field and wooded areas west of the NAR and north of the former production area, adjacent areas needed for construction, and other areas appropriately addressed as part of this action. The main objectives of this report are to document what remedial actions occurred in A1PI, describe the certification process, present the data supporting the certification that the Area-Specific Constituents of Concern (ASCOCs) do not exceed the FRLs specified in the OU5 ROD, and describe access controls implemented to prevent recontamination.

The Operable Unit 5 Feasibility Study identified areas in A1PI that required excavation to meet the FRLs. Once stormwater controls and stockpile areas were established, approximately 59 acres within A1PI were excavated. This excavation was divided into two subareas, east of the NAR and west of the NAR. Contaminated soils were excavated and stockpiled on the same side of the NAR so as to reduce the safety concerns of transversing the active roadway. As part of the excavation process, underground drain tiles near the proposed On-Site Disposal Facility (OSDF) were removed to eliminate potential drainage pathways for leachate.

Prior to excavation, the area was divided into 82 certification units (CUs) based on a number of factors, including: spatial analysis results, homogeneity of contamination, topography, designed excavation limits, and process knowledge. Two additional CUs were created, bringing the total to 84,

when the initial certification for one CU failed, leading to follow-up corrective actions. The certification process consisted of sampling and analysis of physical samples in each CU, and a statistical analysis of the data to determine if the CU met the certification criteria. In A1PI, the CUs were analyzed for five primary ASCOCs (total uranium, radium-226, radium-228, thorium-228, and thorium-232); and for five secondary COCs: metals (arsenic and beryllium), PCB (aroclor-1260), and radiological (cesium-137 and thorium-230) as required. Certification sampling consisted of sampling each CU for the known contaminants at a minimum density of 12 samples per CU for primary COCs, and of 9 samples per CU for secondary COCs, at randomly selected locations. The certification samples were then submitted to FEMP approved laboratories, analyzed, and reported to analytical support level (ASL) D. The data were then validated with 90% of sample results validated at Level B, and the remaining 10% at Level D. The data were then analyzed statistically to determine if the certification criteria was met. These criteria required that the mean soil concentration within the CU be below the FRLs, with a minimum statistical confidence of 95% for primary COCs, and a minimum 90% for secondary COCs. The certification criteria also specified a "hot spot" criteria, which requires that no primary COCs be present in the certification samples at levels exceeding 2 x FRL. When statistical analyses demonstrated that the criteria were not met, corrective actions were taken until all the ASCOCs passed the FRL and "hot spot" criteria.

All except three original CUs met the certification criteria on the first attempt. Based upon statistical analysis of the certification samples, collected following initial remedial actions, it was determined that CU P17-32 failed the average concentration criteria for arsenic, Q18-40 failed for radium-226, and O20 failed for radium-228. CU O20 also failed the "hot spot" criterion with one sample for total uranium exceeding 2 x FRL. Corrective actions were taken for each CU in order to meet the certification criteria. For P17-32, an additional 6-inch layer of soil was excavated from the CU in order to attain certification. In Q18-40, the CU was divided into two new CUs (Q18-40A and Q18-40B) to certify for radium-226. Since the initial certification results showed that most of the contamination was in Q18-40B, six inches of soil was excavated from this CU. New certification samples were taken in Q18-40A and Q18-40B, and both CUs attained the certification criteria without further corrective actions. For CU O20, two corrective actions were necessary. For the total uranium "hot spot," the area of contamination was delineated and excavated. A new certification sample was taken, and the sample result (12.81 mg/kg) was well below the FRL. For the O20 radium-228 concentration, the failure was a result of high statistical variation within the CU. The corrective action

was to collect additional random physical samples to increase the confidence level. With the expanded data set, statistical analysis demonstrated that the certification criteria was attained. The six CUs comprising the Old North Access Road (NAR) and ditches in A1PI (CUs NAR 1-6) were certified "in place" by taking waste acceptance criteria (WAC) and certification samples at depth and analyzing them as per previous agreement with the regulatory agencies. No WAC or certificaiton sample result obtained from these CUs was at or above FRLs for ASCOCs. In order to remove artificial or imported media that cannot be certified, a level of excavation into native material residing beneath the road fill is specified. When this road and fill material in CUs NAR 1-6 is excavated to the specified depth, CU certification will be considered complete. However, due to construction demands, completing excavation of the NAR CUs will be a phased process dictated by the OSDF construction schedule.

Beginning at coordinate N 483445, E 1351342 approximately 1,300 feet of the NAR within the OSDF footprint (cells 1, 2 and half of cell 3) has been excavated to or beyond the specified certification depth. This excavated zone currently terminates at coordinates N 482175, E 1350928 which is approximately 250 feet north of the southern extreme of the A1PI NAR CUs. The southern (250') and northern (350') sections of the old NAR will not be considered certified until the artificial or imported materials have been excavated.

A northern section of approximately 350 feet of the NAR, between the intersection of the new NAR and the OSDF northern perimeter, has been left intact to provide support for OSDF construction. This unexcavated section of roadway must be kept intact until OSDF construction is completed. The remaining southern 250 foot section of certified in place old NAR will be excavated in July 1998 to accommodate construction of the OSDF Cell 2 compacted clay liner. A separate certification letter report for the southern section of the road will be submitted to the regulatory agencies after excavation to certification depth. The northern section of the old NAR will be transferred to Area 10, Corridors. Neither the southern nor northern section is included in this report.

Since all the CUs discussed in this report (except the remaining portions of CUs which will be excavated in the future) have passed certification, they can be released for final land use. In order to protect the integrity of certified areas from recontamination after certification has been completed, access restrictions to certified areas are maintained by DOE. A procedure has been developed to control access to certified areas.

SECTION 1.0
INTRODUCTION

1.1 PURPOSE

This Certification Report presents the information used by the United States Department of Energy (DOE) to determine that contaminated soil cleanup objectives were successfully achieved in Area 1 Phase I (A1PI) at the FEMP. On the basis of this reported information and supporting project files, DOE requests concurrence that the remedial actions are complete for all certification units (CUs) in this report. DOE has also completed follow-up regrading and reseeding operations and begun construction of the On-Site Disposal Facility (OSDF).

1.2 BACKGROUND

The Operable Unit 5 (OU5) Record of Decision (ROD), issued in 1996, established a DOE commitment to execute remedial actions to excavate contaminated soil that exceeds health-based final remediation levels (FRLs) with final disposition of the excavated material in the OSDF. The OU5 Remedial Investigation Report defined the extent of soil contamination exceeding the FRLs, and in general, indicated widespread contamination occurring in approximately 430 acres of the 1050-acre FEMP site. Approximately 1.8 million cubic yards (yd^3) of contaminated soil are anticipated to be excavated and placed within the OSDF.

The OU5 Remedial Action Work Plan (RAWP) established a commitment on the part of DOE to prepare a design document, the Sitewide Excavation Plan (SEP), defining the overall approach to implementing the soil cleanup obligations in the OU5 ROD. Discussions between DOE, the US Environmental Protection Agency (US EPA) and the State of Ohio EPA (OEPA) identified the desire to proceed with soil cleanup activities in A1PI prior to finalizing the sitewide strategies defined in the SEP. The soil remediation project was accelerated to facilitate removal of soil exceeding the FRLs in the northeast corner of the site. This included the area comprising the footprint of the initial two OSDF cells, adjacent areas needed to facilitate the construction effort, and other areas appropriately addressed as part of this action. In general, A1PI is comprised of approximately 123 acres located on federal property at the northeast corner of the site, as shown in Figure 1-1, General Remediation Areas 1 through 10. Following remedial action, Cell 1 of the OSDF and a relocated North Access Road were constructed in this area.

To support soil remediation activities, two types of documents were prepared to describe and guide planned activities in A1PI:

- A1PI Remedial Action Work Plan (RAWP);
- Project Specific Plans (PSPs) (Refer to Appendix D for a summary of A1PI PSPs).

The development of these documents established the constituents of concern (COCs) relative to A1PI remediation activities. Available characterization data from the OU5 RI Report were used to estimate the limits of required excavation in A1PI to attain the FRLs defined in the OU5 ROD for the individual COCs. Excavation activities were completed based upon this initial estimate. In general, a six-inch layer of soil was excavated from 59 acres of A1PI, these areas are depicted in Figure 1-2. The large, non-impacted forested area west of the North Access Road, north of the former production area, was not excavated; whereas the area east of the production area was excavated. Soil samples were collected from randomly selected locations within segmented areas, Certification Units, that encompassed the entire A1PI area. These samples, termed certification samples, were analyzed to determine the concentration of area-specific COCs remaining in the individual CUs.

The results of these analyses were statistically evaluated on an individual CU basis to determine if the FRLs were attained. When the statistical tests identified that the FRLs were not attained, additional corrective actions were taken. These actions included additional excavation of affected areas or collecting additional samples to increase the statistical confidence. Corrective actions continued until the post-excavation sampling results indicated that all areas in A1PI attained the FRLs. This report documents the sampling and analysis performed, the statistical evaluation conducted, applicable corrective actions, and the decisions reached regarding the attainment of the FRLs in A1PI.

1.3 SCOPE

The scope of this Certification Report includes the presentation and discussion of the certification results of the approximately 123 acres in A1PI. This area in the northeast portion of the site includes the location of the initial two OSDF cells, the northern portion of the existing North Access Road (NAR), the 63 acres of open field and wooded areas between the existing NAR and the old NAR, the Pump Station, and the OSDF Sediment Basin. This area was originally divided into 82 CUs, and 2 CUs were added as a result of corrective actions. As discussed with the regulatory agencies, the scope

of this report includes these 84 CUs only. Section 2.0 provides further detail regarding the CUs within A1PI. The certification results for the A1PI Sediment Traps 2 and 3 are not presented in this report, nor is borrow Area C which was originlly part of the A1PI RAWP. The certification of these areas will be discussed in the future Area 1 Phase II Certification Reports.

Certification for A1PI consists of demonstrating that the individual CUs attained the FRLs based on statistical analysis. The certification criteria requires that the average COC concentration within the CU to be below the FRL, with a minimum statistical confidence of 95% for primary COCs, and a minimum of 90% for secondary COCs. Furthermore, for primary COCs, no single sample result within a CU can be at or above two times its corresponding FRL. The CU is considered certified when these criteria are met.

Within A1PI, different COCs are present in different areas because of varying production and waste storage activities. Area-specific COCs (ASCOCs) are defined as those COCs detected at concentrations above the FRLs, and/or where process knowledge indicated that COCs are likely to be present at levels above the FRLs in A1PI. The A1PI ASCOCs presented in the A1PI RAWP are the analytes for which soil certification was determined. These ASCOCs include:

- Primary COCs
  Radiological: total uranium, radium-226, radium-228, thorium-228, and thorium-232
- Secondary COCs
  Metals: arsenic and beryllium;
  Polychlorinated Biphenyl (PCB): Aroclor-1260;
  Radiological: cesium-137 and thorium-230.

The strategy for identifying primary and secondary ASCOCs for A1PI is discussed in Section 2.1.2. Certification sampling for A1PI consisted of systematically sampling each CU for the known primary and secondary COCs.

1.4 OBJECTIVES

The objectives of the A1PI Certification Report are:

- Describe the remediation strategy and excavation results;
- Describe the physical sampling process, analytical methods, data validation processes, data reduction and statistical processes used to support certification;
- Present certification sampling results for the original 42 radiological, 30 metal, and 7 PCB CUs, plus two additional CUs created for corrective action following CU failure;

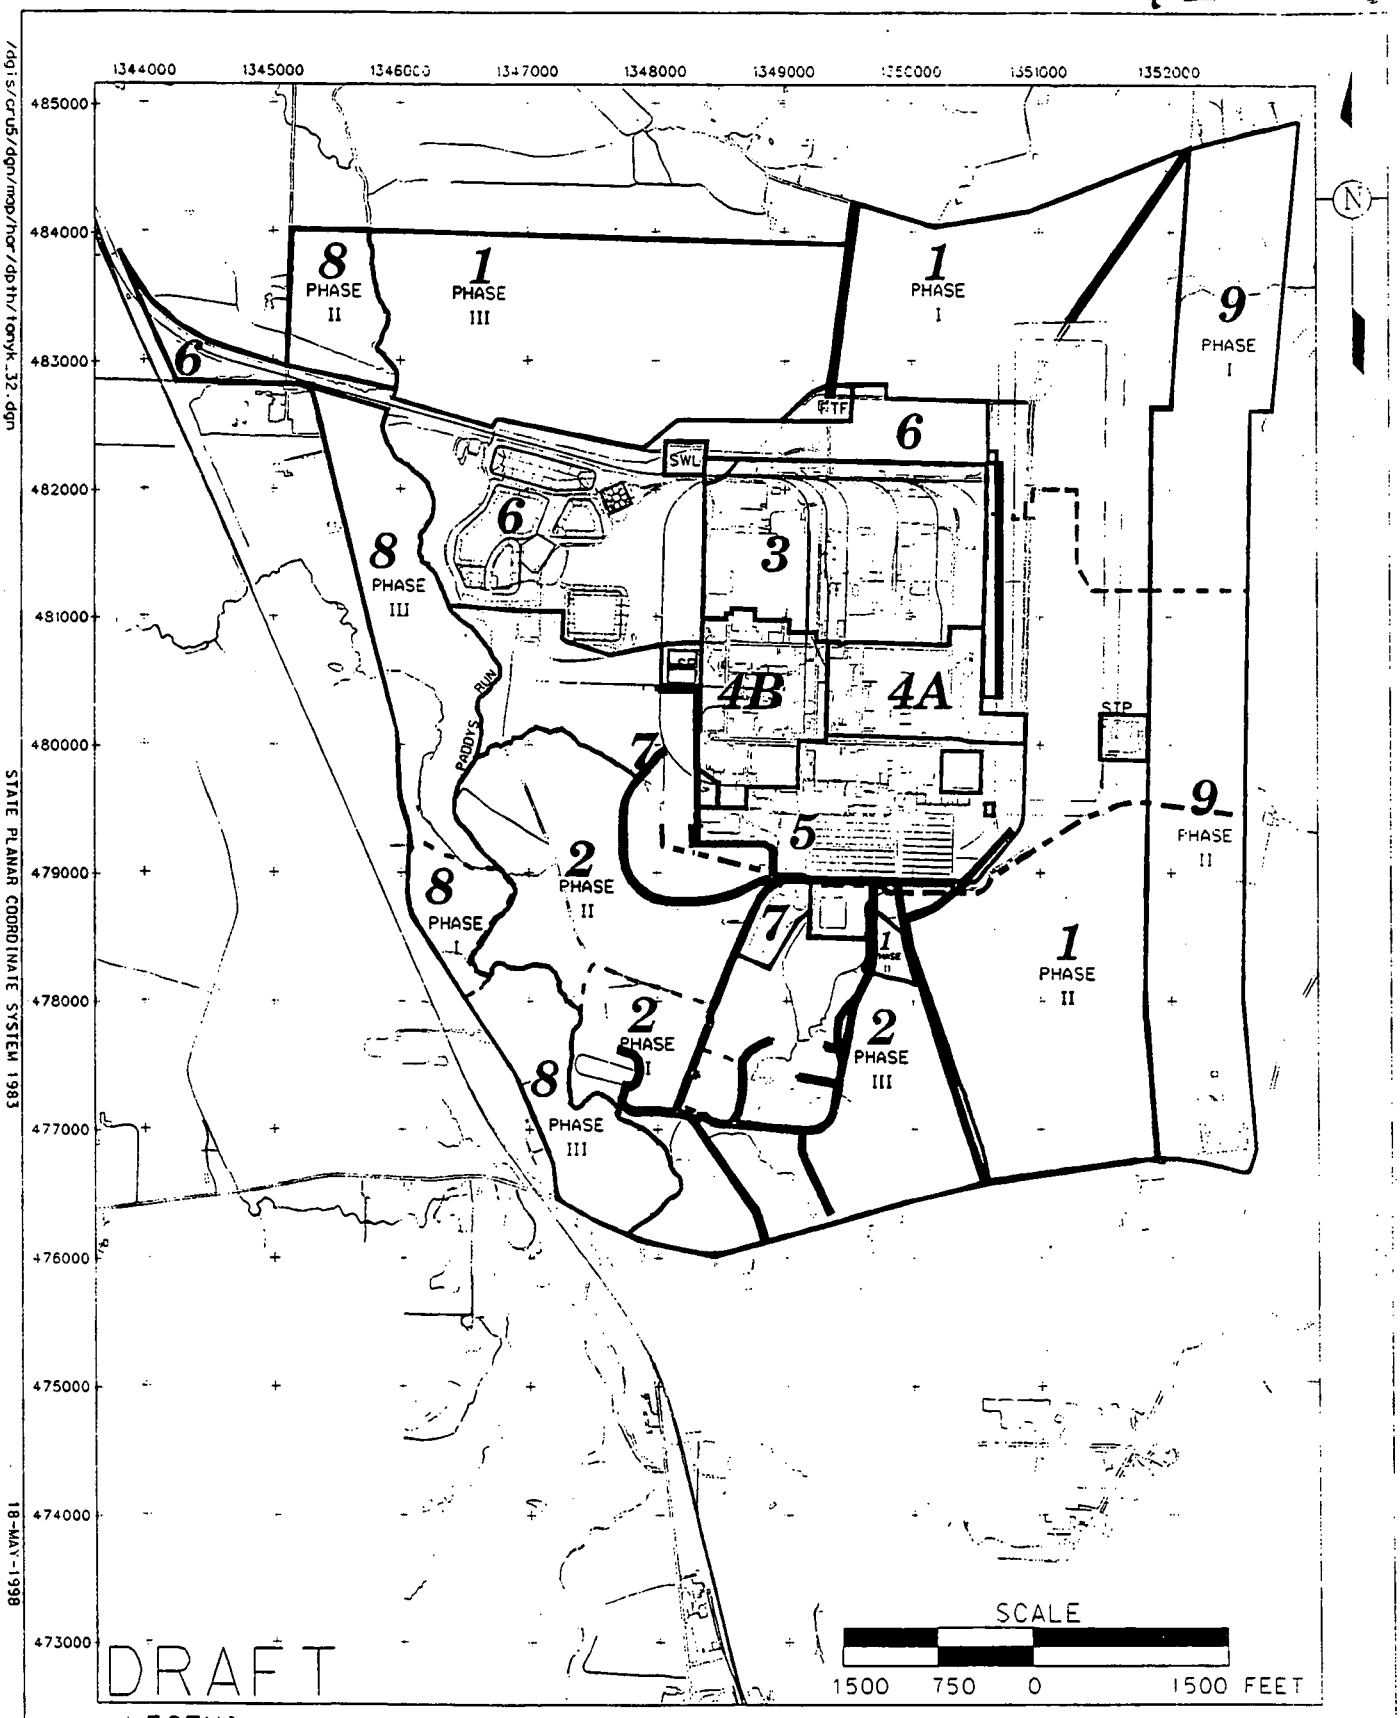

FIGURE 1-1. GENERAL REMEDIATION AREAS 1 THROUGH 10

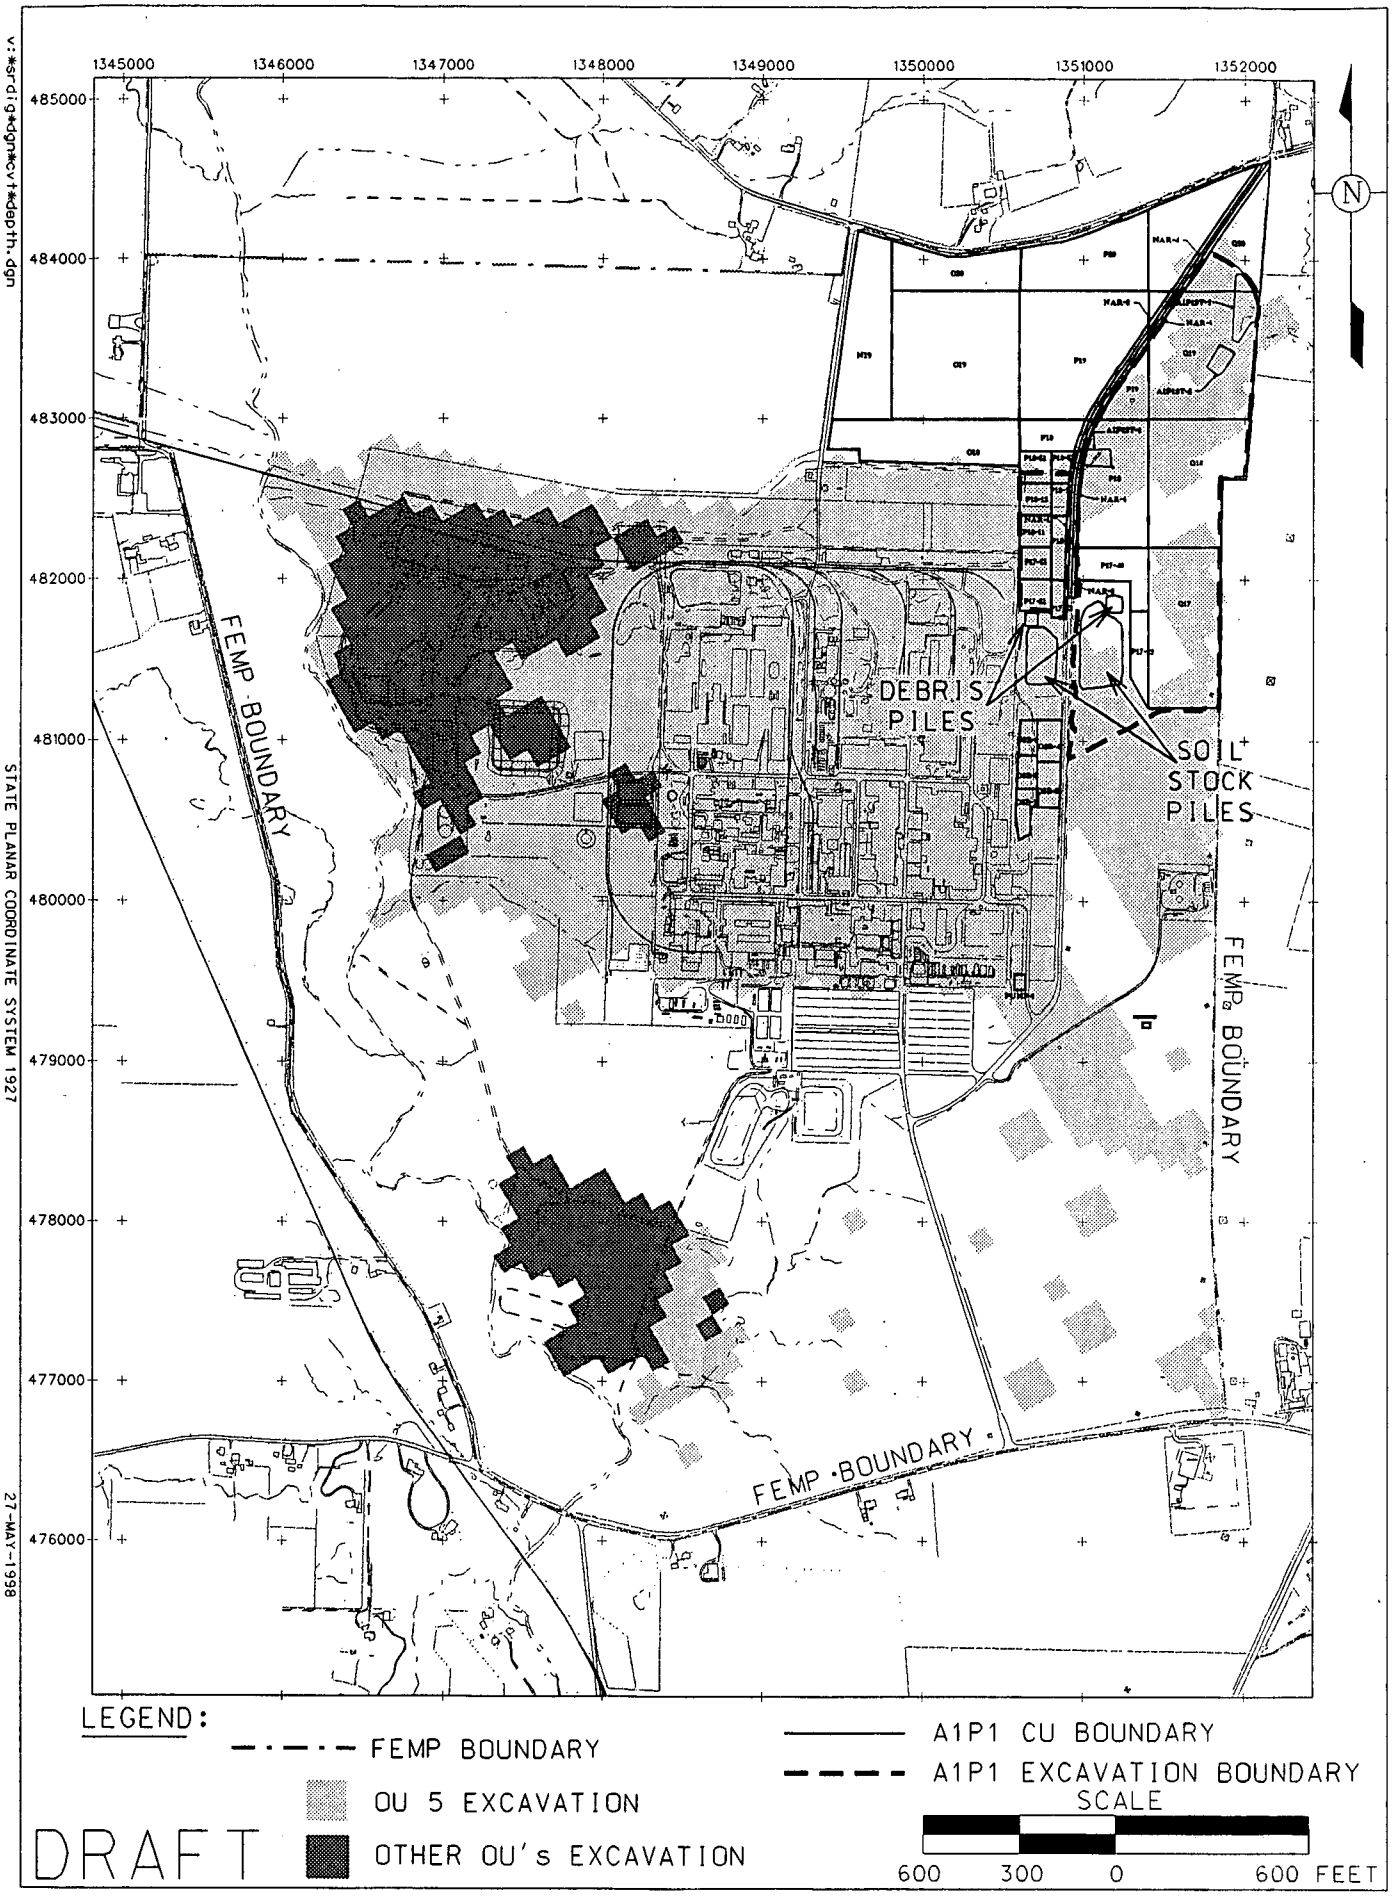

FIGURE 1-2. PRELIMINARY SITEWIDE SOIL EXCAVATION FOOTPRINT BASED ON RI/FS CHARACTERIZATION DATA

SECTION 2.0
CERTIFICATION APPROACH

2.1 CERTIFICATION STRATEGY

For purposes of this report, all discussion in this section is a description of the A1PI certification strategy, which will differ from that utilized for all other FEMP remediation areas. The certification strategy for the rest of the FEMP is defined in the Sitewide Excavation Plan (SEP).

The purpose of certification sampling is to verify that the mean concentrations or activities for ASCOCs remaining in the soil of a CU following remedial activities are less than the FRLs at the appropriate confidence level. If the mean residual concentrations or activities are below the FRLs within the respective confidence bounds, the remedial objectives have been achieved for the CU and it can be released for regrading, reseeding and development of a final land use. Where FRLs for a given constituent were exceeded in a CU as determined by the appropriate statistical test, corrective actions were taken until all FRL criteria were attained. An overview of the A1PI soil remediation process is depicted in Figure 2-1, A1PI Soil Remediation Process Flow Diagram.

Certification was demonstrated by collecting and analyzing physical soil samples in each CU, and evaluating the data based on statistical analysis. The A1PI remediation area was divided into CUs prior to excavation, as discussed in Section 2.2. Additionally, required waste acceptance criteria (WAC) evaluation, including Remedial Investigation/Feasibility Study (RI/FS) data assessment and process knowledge review, was completed prior to excavation to establish confidence that all soil designated for final disposal in the OSDF meets the WAC. A separate A1PI WAC Report, discussing the strategy and approach for WAC attainment and documenting the WAC sampling results will be provided separately from this Certification Report.

2.1.1 Sitewide Soil COCs

The OU5 ROD established FRLs for soil for 80 COCs. These COCs were identified through examination of the OU5 remedial investigation data set, which included the results from the laboratory analysis of thousands of soil samples obtained both on and off the FEMP property. To properly focus remedial activities and certification sampling on the key COCs, a COC evaluation matrix was developed to 1) identify those COCs with the greatest potential impact on human health and the

environment, and 2) eliminate those COCs with negligible value to the remediation requirements. This evaluation matrix considered five variables:

- The frequency of detections above FRLs for each of the 80 COCs in soil in the OU5 remedial investigation data set,
- The relative significance of the contribution to potential human health risk posed by post-remedial residual soil concentrations for each COC,
- The ratio of exposure point concentrations for each COC to the FRL,
- A comparison of the FRL for each COC to established soil background concentrations, and
- Process knowledge.

This evaluation process resulted in the selection of 30 COCs to drive sitewide soil remedial activities. These COCs are listed in Table 2-1, Summary of Sitewide COCs. COCs were assigned based on the frequency of detections above the FRLs. These 30 sitewide COCs account for 99% of potential risk to the hypothetical future undeveloped park land user. The undeveloped park land user was the exposure scenario for the derivation of the risk based FRLs in the OU5 ROD.

These 30 sitewide COCs were further evaluated by examining the spatial distribution of their sample results in the OU5 remedial investigation data set. The COCs were classified as primary or secondary based on an examination of this spatial distribution with consideration of the results of the COC evaluation matrix. Primary COCs are those contaminants which represent 90% of the potential risk to human health from exposure through the soil pathways, and for which available data indicated widespread distribution of the COCs across the study area. Five sitewide primary COCs were identified by this process: total uranium, radium-226 and -228, and thorium-228 and -232. The spatial distribution of above-FRL detections of these primary COCs approximate the total expected soil excavation footprint. The remediation of the primary COCs is driven by their respective FRLs.

The 25 secondary COCs, which were associated with more localized areas of contamination above the FRL, are identified in Table 2-1. COCs are classified as secondary if the extent of contamination is limited to localized areas, or if the COCs have been infrequently detected in concentrations marginally above the FRL over large areas (e.g., metals). Secondary COCs typically, but not exclusively, reside within the footprint of the primary COCs.

2.1.2 A1PI Soil COCs

The sitewide COCs were examined for their appropriateness for application to A1PI. The identification of ASCOCs for A1PI was completed based upon an analysis of available data which indicated the existence of above-FRL concentrations or activities within the A1PI area. In order to make this determination, spatial analyses relative to the FRLs were conducted on all existing soils data within A1PI. The purpose of these area-specific spatial analyses was to review the actual distribution of contamination for each COC, and to estimate the extent of contamination exceeding the FRL. The conclusions of these analyses were used to initially design the CU configurations for the COCs to ensure remediation activities in the area were successful in complying with applicable FRLs.

The spatial analyses resulted in the identification of the five primary COCs and five secondary COCs specific to A1PI. These COCs were identified as being present or having a high probability of presence at or above the FRLs, as shown in Table 2-2, Summary of Area 1 Phase I Area-Specific Constituents of Concern. Additionally, four ecological COCs (aluminum, manganese, molybdenum, and lead) were identified as being present or having a high probability of presence at or above corresponding Benchmark Toxicity Values (BTVs). Analytical data for these ecological COCs were collected in A1PI during certification sampling. However, these ecological COCs were not considered in the certification determination. Appendix A presents the results and simple statistics for the BTV data collected.

The primary and secondary COCs, as listed in Table 2-2, represent the demonstrated or likely contaminants in A1PI. The spatial distribution of these COCs in A1PI does not indicate that any one contaminant completely envelops other COCs in both horizontal and vertical extent. Thus, sampling and analysis were performed for all 10 COCs during certification to demonstrate that the post-remediation residual soil levels comply with the applicable standards.

2.1.3 Certification Sampling

Certification sampling was conducted by randomly collecting samples from the systematic grid within each CU. Section 2.4 includes a discussion of the sample point assignment process for A1PI. Each CU was divided into approximately 16 equal sized grid sub-CUs. At a minimum, a discrete primary COC sample location was randomly selected from 12 of the 16 sub-CUs. For secondary COCs, a

minimum of 9 sample locations was randomly selected for secondary COC analyses, when applicable. Laboratory and data validation methods are described in Section 4.0.

2.2 CERTIFICATION UNIT ASSIGNMENT

A CU is a predefined area which was sampled at a specified density during certification to demonstrate that the average residual COC soil concentrations were less than the soil FRLs. Table 2-3, Summary of Certification Unit Criteria, identifies three classes of CUs: Class I, Class II and Class III. The assignment of the class of CU applicable to a given area is based on three factors: 1) interpretation of the spatial analysis of existing characterization data for COCs having analytical detections above their FRL, 2) process knowledge, and 3) topography (including surface hydrology) of an area. A 200' X 200' sitewide grid system was established across the FEMP as the foundation for CU determination. This grid was also used to identify CUs in unique alpha-numeric labeling system. In A1PI, there were some circumstances, such as ditches, roads and sediment traps, which prompted the designation of irregular shaped Cus. The A1PI CUs are summarized in Table 2-4, A1PI Certification Units.

Similar certification testing protocols were used for all CUs, regardless of size or shape. For example, a minimum of 12 samples for primary COCs and, when applicable, a minimum of 9 samples for secondary COCs, were collected within the boundaries of each CU. However, to gain additional confidence for certification purposes, 16 or more samples were collected from several CUs. Section 2.3 includes a discussion of the justification for the number of samples necessary to determine certification.

2.2.1 Classes of CUs

The design of CUs is based primarily upon the demonstrated impact a constituent or group of constituents had on a specific geographic area relative to their soil FRLs. During the RI/FS process, sampling programs were designed to identify soil contamination based upon process knowledge (areas where possible releases may have occurred), and topographic areas of likely deposition (such as air deposition areas, surface runoff, etc.) The CU designations are primarily based upon the spatial analysis of these data and the geographic proximity to impacted areas.

Where applicable in A1PI, consideration of topography such as ditches or areas of likely deposition, and process knowledge were used to conservatively assign certification units. An example of this

process is the designation of Class I CUs for PCBs along the former production area. A release of oil from a PCB-containing transformer occurred near this area. This area demonstrated no PCBs above soil FRLs; however, to ensure that the area was not affected by this event, Class I PCB CUs were designated in the area that had potential for impact by the release. This same logic was applied when assigning other PCB CUs, such as O18 and NAR-1.

Descriptions of the three classes of CUs follow.

Class I - Demonstrated Contamination

CUs within sections of A1PI that demonstrated pre-remedial contiguous contamination, or a high probability of contamination above FRLs, are designated as Class I CUs (CU-I). A default CU-I consists of one (1) 200' X 200' grid (0.92 acres). The shape and size of a CU-I varied due to topography, physical obstacles, and engineering considerations. By definition, however, the size of a CU-I did not exceed one acre.

Class II - Marginal Contamination

CUs in sections of A1PI demonstrating marginal or scattered detections above the FRLs, which are relatively homogeneous, and are not adjacent to contaminated areas, were designated as Class II CUs (CU-II). A default CU-II consists of four 200' X 200' grids (e.g., 400' X 400'), or 3.7 acres. The shape and size of a CU-II varied due to topography, physical obstacles, and engineering considerations. By definition, however, the size of the CU-II does not exceed four acres.

Class III - Improbable Contamination

Class III CUs (CU-IIIs) were designated in peripheral sections of A1PI for soil exhibiting no indication of contamination as a result of spatial analysis of existing data and process knowledge. A default Class III CU consists of (16) 200' X 200' grids (e.g., 800' X 800'). The shape and size of a Class III CU varied due to topography, physical obstacles, and engineering considerations. By definition, however, the size of a CU-III did not exceed 16 acres.

Special Certification Units

Some areas requiring certification in A1PI could not be classified using these classification criteria. For example, CUs assigned to certify the existing roadway prior to excavation (NAR-1 through 6), a

sediment trap requiring certification in place (A1PIST-1), and CUs that were created for facilities and other long-term infrastructure needs (e.g., Pump 1) were designated as special CUs. The PSP for OSDF Support Areas Certification Sampling (Rev. 0) included a discussion of these special CUs, and the approach and sampling strategy used. These CUs exhibited homogeneity of known or probable contamination based on process knowledge. In A1PI, each of these specific CUs was treated as a Class I CU for certification purposes.

2.3 CERTIFICATION UNITS

Figure 2-2, A1PI Radiological Certification Units, Figure 2-3, A1PI Metals Certification Units, and Figure 2-4, A1PI PCB Certification Units, depict the certifications for radiological, metals, and PCB CU tupes, respectively. Detailed maps of each CU and all of the certification sample points for each suite of analyses are included in Appendix A.

For various reasons, the CUs in A1PI were reconfigured or created as compared to the original CU designs that were presented in the original A1PI PSPs and the A1PI RAWP. Figures 2-5, 2-6, 2-7, and 2-8 depict the CUs as designed and presented in the A1PI Certification PSP. All changes made to the configuration of the CUs considered the homogeneity of probable contamination and the spatial analysis of existing data. The reasons for the reconfigurations or additions of affected CUs are summarized in Table 2-5, Area 1 Phase I Certification Unit Reconfigurations and Additions. The descriptions in Table 2-5 use the final CU locations and nomenclature as presented in this report. The original configurations are included as Figures 2-5 through 2-8; however, revisions representing the evolution of the CUs from the original design to final configuration do not exist.

2.4 DETERMINATION OF NUMBER OF SAMPLES FOR CERTIFICATION

In order to certify a CU as meeting the FRL clean-up criteria, it was demonstrated that the average concentration or activity level for each COC was below its respective FRL with an acceptable confidence level. To determine the number of samples needed to certify the CU as having achieved the FRLs, the following formula was used:

$$n = \frac{(Z_{1-\alpha} + Z_{1-\beta})^2}{\left(\frac{RG - \bar{X}_{target}}{S_{CA}}\right)^2}$$

where

α = *probability of a Type I Error* (.05)
β = *probability of a Type II Error* (.20)
Z = *critical level (the designated probability for normal distribution)*
RG = *the Remedial Goal (i.e. FRL for the given analyte)*
$\bar{x}_{target}$ = *target clean-up level mean*
= *75% of the FRL*
S_{CA} = *standard deviation estimated for post-remedial conditions*

2.4.1 Assumptions

To meet the target confidence levels for certification (95% for primary COCs and 90% for secondary COCs), three assumptions were required. The first assumption was to establish the false negative error rate (Type I Error) and the false positive rate (Type II Error). The acceptable false negative rate, i.e., the probability of declaring that a CU meets the FRL when, in fact, the average exceeds the FRL, was set to correspond with the more conservative of the two confidence levels at 5 percent. The false positive error rate, i.e., the probability of declaring a CU as not meeting the FRL when, in fact, the average is below the FRL, was set at 20%.

A second assumption was that, when certification sampling was implemented for a CU in A1PI, the maximum expected average concentration or activity level is no greater than 75% of the FRL, or the "target cleanup level." The 75% level was chosen based on a cost-benefit analysis. It was considered more cost-effective to establish a conservative target level and recognize the possibility that a CU could be sampled, fail certification and require resampling rather than implement a more intensive certification readiness program, especially in light of the many unaffected areas within A1PI.

The third assumption was that the variability demonstrated in non-impacted areas would be similar to post-remedial conditions in impacted areas. Operating on this assumption, an estimate of the data variability (standard deviation) for post-remedial conditions was calculated from existing data in non-impacted areas as defined by levels of all ASCOCs being below their respective FRLs. The method used to estimate the standard deviation for each analyte in the non-impacted area was as follows:

1. The site was divided into 100 ft. by 100 ft. blocks. This was accomplished by dividing the Northing and Easting coordinates by 100 since these coordinates are presented in feet.

2. Block averages were calculated for each 100 x 100 ft block.

3. Blocks were categorized as either impacted (average greater than or equal to the FRL) or un-impacted (average less than the FRL).

4. All sample locations in impacted blocks were eliminated from consideration.

5. The final screening was to remove any sample in excess of 3 x FRL since these sample values would immediately trigger a localized remedial effort. This model was developed based on 3 x FRL hot spot criteria. However, based on subsequent discussion with US EPA and OEPA, the criteria was revised to 2 x FRL.

6. Standard deviations were calculated for each individual analyte from data from unaffected areas.

7. For ease of sampling and analysis, it was decided that the number of samples to be collected and analyzed for primary ASCOCs will be based on the maximum calculated sample size for all primary and secondary ASCOCs.

Under these assumptions and methods, the minimum estimated number of samples required for each CU was determined to be 12 for primary ASCOCs and 9 for secondary ASCOCs. The minimum number of samples per CU necessary to demonstrate certification was determined by the analytes requiring the greatest number of samples. The calculations, radium-226 and thorium-232 for the primary ASCOCs, and the sampling requirement for arsenic, established the CU sampling frequency driver for the secondary ASCOCs. Table 2-6, Summary of Estimated Number of Samples per Certification Unit in Area 1 Phase I to Achieve Acceptable Confidence Levels, summarizes the sample size results. For simplicity of sampling and analysis, the two secondary radiological ASCOCs (cesium-137 and thorium-230) were included in the analytical suite for primary ASCOCs, since the primary ASCOCs are all radiological analytes.

An example calculation of the sample size for thorium-232, estimated by applying this method, is provided below. Starting with the initial equation:

$$n = \frac{(Z_{1-\alpha} + Z_{1-\beta})^2}{\left(\frac{RG - \bar{x}_{target}}{s_{CA}}\right)^2}$$

Then, substituting in the values for

α = *probability of a Type I Error* = 0.05
$Z_{(1-0.05)} = Z_{0.95}$ = 1.645
β = *probability of a Type II Error* = 0.20
$Z_{(1-0.20)} = Z_{0.80}$ = 0.842
RG = *the Remedial Goal, FRL* = 1.5 *pCi/g*
$\bar{x}_{target}$ = *target clean-up level mean*
= *75% of the FRL* = 1.125 *pCi/g*
S_{n_A} = *standard deviation estimated non-impacted areas* = 0.503 (*from Table* 2-5)

gives

$$n = \frac{(1.645 + 0.842)^2}{\left(\frac{1.5 - 1.125}{0.503}\right)^2} = 11.128$$

To ensure that the alpha and beta error rates are satisfied under the given assumptions, the calculated number was rounded up to the next highest integer. In this case, the calculated value of 11.128 was rounded up to 12. Therefore, under the given assumptions, a minimum of 12 samples per CU was required for thorium-232 analysis in order to establish the appropriate confidence level to certify the CU.

2.5 SAMPLE DESIGN

A sampling plan strategy was designed after the minimum number of samples for certification was determined. In A1PI, the CUs for primary and secondary ASCOCs are not necessarily the same CUs. If the CU was not the same for both primary and secondary ASCOCs, the sample locations were generated independently. During the initial stages of A1PI, the sample locations were generated independently, even if the primary and secondary CUs were coexistent. Later, to improve efficiency, the primary and secondary samples were drawn from the same location if the primary and secondary CUs were coexistent.

A systematic random sampling plan was used to maintain the assumptions of random sampling for the certification determination analysis. In general, each CU was subdivided into 16 sub-CUs. The layout of the sub-CUs was arbitrary; the only stipulation was that each sub-CU represents approximately one sixteenth of the total area for the CU. The "one-sixteenth" stipulation was included in order to drop the

"weighting factor," i.e., the percentage of total area represented by the data point, from the subsequent statistical calculations. This action simplified calculations and interpretation of results. A minimum of 12 of the 16 sub-CUs were sampled for primary ASCOCs, and 9 for secondary ASCOCs. These variations are outlined in the following summary of the procedure for generating the random sampling locations. As discussed in the OSDF Support Areas PSP, 16 samples were collected in the CUs for all ASCOCs for these areas.

2.5.1 Procedure for Generating Random Sample Locations

The procedure used to generate random sample locations for each CU is summarized as follows.

1. Sub-divide the CU into 16 approximately equal (area-wise) sub-CUs.
   - A. For CUs approximating rectangular shapes, the CU was subdivided into 16 equal sub-CUs by griding the area four across the east-west direction, and four across the north-south direction.
   - B. For CUs approximating triangular shapes, the area was divided into 16 equal sub-CUs. These CUs were formed when an originally planned CU is divided by a newly imposed diagonal boundary. An example of this occurrence was CU Q20-30 which was a remnant area after the North Access Road was redesignated as a series of CUs.
   - C. For irregular shaped CUs, maps were generated by GIS personnel for each CU. The CU was divided visually into 16 equal sized sub-CUs, and these maps were given to the GIS personnel to overlay onto the electronic GIS-based CU map. Each CU size was calculated and resized until all sub-CU areas were approximately equal.
2. Generate sample locations.
   - A. For rectangular CUs: A random northing coordinate was generated between the minimum and maximum northing coordinates of the sub-CU, and a random easting coordinate was generated between the minimum and maximum easting coordinates. These random coordinates were rounded to the nearest foot for the surveyors to locate the sample.
   - B. For non-rectangular CUs: A "bounding box" was overlaid around the CU defined by the minimum and maximum northing and easting coordinates of the CU boundary. Sequential random locations were generated within the box limits, and the locations were plotted on the CU map. Coordinates were rounded to the nearest foot. Locations that fell outside of the CU boundary were discarded. Locations in a sub-CU were retained. This process was repeated until each sub-CU contained only one sample location.

NOTE: A list of 50 - 150 sets of three random numbers were generated. The first number was the easting coordinate within the box. The second was the northing coordinate within the box. The third was a random number. This list was sorted by random numbers and indexed by their position in the list. The entire list was plotted on the sub-CU map, with each location labeled with the index value. The location with the smallest index was selected, and the others were discarded. This method was identical to the one-point-at-a-time-method and generated random and unbiased locations.

C. Sub-CUs were chosen for sampling for the 12 primary ASCOCs or the 9 secondary ASCOCs. A random number was assigned to each of the 16 sub-CUs, with the 12 or 9 sub-CUs with the lowest assigned numbers selected. The remaining four primary sub-CUs were generally designated primary archive samples, with three of the four as secondary archive samples. When the primary and secondary CUs did not co-exist, the 12 primary and 9 secondary samples were chosen independently.

2.6 CERTIFICATION UNIT ANALYSIS

Certification sampling consisted of systematically sampling each CU for the known contaminants at the predetermined sample density. The certification of a CU within A1PI required the average soil concentration of COCs within the CU to be below the FRLs, with a minimum statistical confidence of 95% for primary COCs, and at least 90% for secondary COCs.

Statistical analysis, specifically hypothesis testing, was performed on the analytical results of the certification samples. The statistical analysis determined whether the average ASCOC levels in a given CU met their respective FRL; i.e., were less than the respective FRL, at the desired level of confidence. Consistent with the conservative approach used to assess COC levels, the null hypothesis for this analyte was defined to presume the average level of a specific ASCOC in a CU is greater than or equal to the FRL. The determination was made by applying the following equation:

$$t = \frac{RG - \bar{x}_i}{\sqrt{S^2/n}}$$

Where:

RG = remedial goal (i.e., FRL)

$\bar{x}_I$ = mean of samples from the i^{th} CU.

S^2 = sample variance

n = number of samples from the i^{th} CU.

If the statistical analysis indicated that the average level of a specific ASCOC in a CU did not exceed the FRL, the null hypothesis was rejected. The ASCOC level did not exceed the FRL if the computed value (t) exceeded the critical value of a t-distribution for alpha = 0.05 for primary ASCOCs and for alpha = 0.10 for secondary ASCOCs at the appropriate degrees of freedom. If this was the case for all ASCOCs within a CU, and if no single sample exceeded 2 x the FRL for primary COCs, the entire CU was certified as meeting the FRLs.

If the average detected result in a CU was not statistically less than the FRL at the minimum confidence level, one of two actions was taken:

- The CU was subjected to corrective actions, i.e., additional excavation, and resampled for certification, or
- If the average level in a CU was less than the FRL but the required statistical confidence was not achieved, additional samples were collected or available archived samples were submitted for analysis to increase the confidence level.

2.6.1 Statistical Quality Control

Quality control measures taken for the statistical data analysis were as follows:

- Algorithm accuracy was checked using Systat for Windows, a PC-based statistical package.
- Spot checks for accuracy were performed on individual spreadsheets to check for accuracy.
- All sample data results were checked for completeness and accuracy.

TABLE 2-1
SUMMARY OF SITEWIDE CONSTITUENTS OF CONCERN

Constituent of Concern	OU5 FRL	Constituent of Concern	OU5 FRL
Primary COCs			
Uranium, total (K_l = 325[a])	82/50 mg/kg	Thorium-228	1.7 pCi/g
Uranium, total (K_l = 15)	20 mg/kg	Thorium-232	1.5 pCi/g
Radium-226	1.7 pCi/g		
Radium-228	1.8 pCi/g		
Secondary COCs			
Aroclor-1254	0.13 mg/kg	Indeno(1,2,3-cd)pyrene	20 mg/kg
Aroclor-1260	0.13 mg/kg	Lead	400 mg/kg
Arsenic	12 mg/kg	Lead-210	38 pCi/g
Benzo(a)anthracene	20 mg/kg	Manganese	4600 mg/kg
Benzo(a)pyrene	2 mg/kg	Neptunium-237	3.2 pCi/g
Benzo(b)fluoranthene	20 mg/kg	Octachlorodibenzo-p-dioxin	0.0088 mg/kg
Beryllium	1.5 mg/kg	Plutonium-238	78 pCi/g
Carbazole	12 mg/kg	Strontium-90	1.4 pCi/g
Cesium-137	1.4 pCi/g	Technetium-99	30 pCi/g
Dibenzo(a,h)anthracene	2 mg/kg	Tetrachloroethene	3.6 mg/kg
1,1-dichloroethene	0.41 mg/kg	Thorium-230	280 pCi/g
Dieldrin	0.015 mg/kg	Trichloroethene	25 mg/kg
Heptachlorodibenzo-p-dioxin	0.00088 mg/kg	Zinc	120,000 mg/kg

a K_l = leaching coefficient. The FRL for total uranium in site soils outside the former production area, sewage treatment plant and the fire training area is 82 mg/kg with an ALARA goal for residual soil concentrations of 50 mg/kg. Within the production area, sewage treatment plant, and the fire training area the FRL for total uranium is 20 mg/kg.

TABLE 2-2
SUMMARY OF AREA 1 PHASE I AREA-SPECIFIC CONSTITUENTS OF CONCERN

COCs	FRL
Primary COCs	**FRL**
Uranium, total	82 mg/kg, with an ALARA goal of 50 mg/kg
Radium-226	1.7 pCi/g
Radium-228	1.8 pCi/g
Thorium-228	1.7 pCi/g
Thorium-232	1.5 pCi/g
Secondary COCs	**FRL**
Arsenic	12.0 mg/kg
Thorium-230	280 pCi/g
Aroclor-1260	0.13 mg/kg
Beryllium	1.5 mg/kg
Cesium-137	1.4 pCi/g
Ecological COCs[a]	**BTV**
Aluminum	10,103 mg/kg
Manganese	1500 mg/kg
Molybdenum	10 mg/kg
Lead	200 mg/kg

a Analytical data for ecological COCs were collected; however, no pass/fail determination was made relative to the BTV levels identified for each respective COC.

TABLE 2-3
SUMMARY OF CERTIFICATION UNIT CRITERIA

	CU-I	CU-II	CU-III
Maximum Certification Unit size	approx. 200' x 200' but not to exceed 1 acre	approx. 400' x 400' but not to exceed 4 acres	approx. 800' x 800' but not to exceed 16 acres
Criteria	Demonstrated Contamination above the FRL, or likely presence	Marginal Contamination	Considered to be Non-impacted
Sampling density	A minimum of 12 random discrete soil samples for primary COCs, and a minimum of 9 random discrete soil samples for secondary COCs	Same as Class I	Same as Class I

TABLE 2-5
AREA 1, PHASE I CERTIFICATION UNIT RECONFIGURATIONS AND ADDITIONS

Justification for CU Reconfiguration	CU	Suite	Result
1) Certification units were reduced in size or eliminated because the limits of soil excavation did not encompass the areas of the originally designed certification units. In cases such as these, the limit of the area being excavated is used as the basis for the designation of the boundaries of certification units.	Q16-31	Primary	eliminated - will be addressed in A1PII
	Q16-32	Primary	
	P17-32	Primary	reduced in size, because primary P17-14 was not excavated entirely, the portion of primary P17-14 that was excavated was consolidated to primary P17-32
	Q17	Metals	reduced in size
2) Certification units were created to account for excavation of soil in an area that was not originally accounted for by the designation of a CU. Areas excavated were not originally planned to be certified.	P17-22	Primary	CU created for area excavated between the A1PI impacted soil pile and CUs primary Q17-10 and primary Q16-33.
	P17-22	Metals	CU created for area excavated between the A1PI impacted soil pile and CUs metals Q17
3) Certification Units were reconfigured to account for the placement of the A1PI impacted soil pile. CUs could not be placed on or beneath the impacted stockpile.	P17-40	Primary	reduced in size
	P17-40	Metals	
	P17-20	Primary	eliminated - will be addressed in A1PII

5) Certification Units were changed to reflect the elimination of Area D from the scope of A1PI. Remediation and subsequent certification of Area D will be conducted with Area 6. Originally, CUs in areas west of the old North Access Road were designated so that the area could be certified, and to prevent potentially contaminated run-on from impacting Area D. Since Area D will no longer be remediated and certified with A1PI, it is no longer necessary to remediate and certify the areas west of the old north access road with A1PI. These areas will be certified with A1PIII.	N19 N19	Primary Metals	reduced in size, incorporated areas east of old north access road only

SECTION 3.0
OVERVIEW OF FIELD ACTIVITIES

3.1 AREA PREPARATION

A1PI remediation involved site preparation activities, including establishing stormwater controls, defining stockpile areas, and instituting access controls. Surface water and stockpile controls were established before any significant remedial activities occurred. Three sediment traps and two sedimentation basins (one on each side of the North Access Road) were constructed. In addition, diversion ditches, berms and silt fences were installed to prevent sediment in non-remediated areas from entering remediated areas (including non-remediated areas both on- and off-property). Silt fencing was also installed to prevent sediment from entering or leaving the remediation area. Boundaries were established for both debris and impacted soil stockpiles. Perimeter fencing and signs were installed to control access into the project work area; the procedure used to control access to the area is summarized in Section 6.0.

Three sediment traps and one sediment basin were constructed to collect runoff from remediated areas, to capture sediment, and to release water to flow across the existing drainage features without additional treatment. An additional sediment basin was constructed west of the North Access Road to collect runoff from the debris and soil stockpiles. This basin releases water to the Stormwater Retention Basin (SWRB). A timed release design allows the SWRB to accommodate the additional load. Treatment and discharge of water entering the SWRB is in accordance with the FEMP National Pollutant Discharge Elimination System (NPDES) permit and OU5 ROD requirements.

3.2 SOIL EXCAVATION

Soil excavation began after the controls for project surface water and waste placement were established. The A1PI Soil Remediation Project was divided into two functional subareas. The A1PI (East) Soil Remediation and Support Facilities Project included all remedial excavations east of the North Access Road. The Site Rail Improvement Project included all remedial excavations west of the North Access Road. Excavating and stockpiling soils on the same side of the North Access Road eliminated the potential for cross-contamination by avoiding hauling soils across the road. A total of 59 acres were excavated in A1PI An approximate six-inch layer of soil was excavated from most of A1PI (East) and placed in the east impacted soil stockpile. Approximately 53 acres were excavated in A1PI (East) (approximately 44.2 acres within the certification area and approximately 9 acres outside the

certification area for the sediment traps, a sediment basin, and stockpile area) and approximately 6 acres were excavated west of the North Access Road, as shown in Figure 3-1, Excavation Limits of A1PI.

3.3 CHANGES TO SCOPE OF WORK

Underground drain tiles within the remediation area located near, but outside, the OSDF footprint were removed to eliminate potential unplanned drainage pathways for OSDF leachate, as shown in Figure 3-2, A1PI Drain Tile Locations. The drain tiles were removed during A1PI activities using a backhoe and were placed in the east debris stockpile. Other drain tiles found within the OSDF footprint will be removed during OSDF construction.

After analysis of certification samples, certain areas were targeted for corrective action due to certification failure as discussed in Section 2.5. The additional volumes derived and a description of the corrective action are as follows:

- Approximately 1300 yd^3 from CU Q18-40b. This material resulted from excavating an additional six inches from the southern portion of the original CU, which was divided into two new CUs (Q18-40a and Q18-40b) when sample results indicated radium-226 exceeded the FRL following the initial excavation. This soil was placed in the A1PI East Stockpile.

- Approximately 950 yd^3 from CU P17-32. This material resulted from excavating an additional six inches from the CU following the determination that arsenic exceeded the FRL following the initial excavation. This soil was placed in the A1PI West Stockpile.

- Approximately 50 yd^3 of soil in CU O20. This material resulted from the excavation of a "hot spot" from the CU following the determination that uranium exceeded the pre-established criterion of 2 x FRL. This soil was placed in the OU1 blending pile.

Following certification, one portion of A1PI was excavated as part of OSDF construction activities. The soil underlying the North Access Road was certified in place as part of the A1PI activities. Samples were collected from the soil at a depth representing the top of the native clays underlying the road bed and adjacent drainage ditches. The soil, macadam (gravel bedding material), and asphalt residing above the certified native clay layer will be excavated during the initial phase of OSDF construction. The soil will be placed in the east soil and debris stockpiles for eventual placement in the OSDF. The certification data presented in this report for the North Access Road CUs represent samples from the native clay soil. This sequence of activities allows the North Access Road to be used as long as possible.

3.4 A1PI SOIL AND DEBRIS VOLUMES

The estimated (from the OU5 Feasibility Study and the A1PI Excavation Design) and actual A1PI excavated soil volumes are summarized in Table 3-1, A1PI Soil Volumes. The volumes and contents of the soil and debris stockpiles associated with the project are discussed in Section 3.4.1, A1PI Stockpiles.

The difference between the OU5 FS Excavation Model and the A1PI Design volumes, approximately 5,124 yd^3, is due to additional soil that was excavated east of the North Access Road. In the OU5 FS Excavation Model, a portion of A1PI east of the existing North Access Road was identified as non-impacted; this portion is shown as non-shaded areas in Figure 3-3, A1PI Excavation Footprint. The designed excavation area in A1PI is depicted in Figure 3-1. Additional soil was excavated during A1PI East Excavation activities for the following reasons:

- In order to segment the areas effectively and to design the excavation of the segmented areas, the areas would have to be separated by levels of COCs within the soils. At the time of the A1PI excavation design, a viable real-time monitoring process to detect radiological COCs was not available to attempt to segment the non-impacted areas from the impacted areas, as designated by the OU5 FS. The collection of analytical data from physical laboratory samples could not be completed within the A1PI excavation design schedule.

- The design would have required excavation of small isolated segments around the non-impacted area. The topography and established drainage patterns within and adjacent to the non-impacted area were such that excessive surface water controls would have been necessary in order to segment the excavation into two to three more parts.

Given the above factors, the conservative approach to excavate the additional area was adopted. Although the OU5 FS Excavation Model designated the area as non-impacted, the more stringent A1PI certification analyses indicated that at least one portion of the area was impacted (Q18-40 was located within the non-impacted area). Nonetheless, the excavation of non-impacted materials as designated by the OU5 FS Model will be minimized in the future.

The excavation of this and similar areas are not anticipated to cause the OSDF designed soil volume to be exceeded. A small percentage of the soil to be disposed in the OSDF will be generated from shallow excavations such as A1PI. Approximately 83% of the soil destined for the OSDF will be generated during the remediation of areas requiring deep excavation, such as the Former Production Area (Areas 3, 4, and 5), Southern Waste Units (Area 2, Phase I), etc.

3.4.1 A1PI Stockpiles

A1PI East Soil Stockpile

Contents: - 33,400 yd^3 from initial excavation of A1PI East
- 1,300 yd^3 from re-excavation of Q18-40b for radium-226 contamination

Total Volume: 34,700 yd^3

A1PI East Debris Stockpile

Contents: - Debris such as trees, concrete rubble, drain tiles, etc., from excavation of A1PI East

Total Volume: 225 yd^3

A1PI West Soil Stockpile

Contents: - 16,000 yd^3 from excavation of Area D for railroad expansion
- 5,700 yd^3 of A1PI West CUs
- 1,900 yd^3 from excavation of the areas necessary to construct the OSDF sediment basin (OSB-1 through - 5) and the OSDF permanent lift station (PUMP-1)
- 950 yd^3 from the re-excavation of P17-32 for arsenic contamination

Total Volume: 24,550 yd^3

A1PI West Debris Stockpile

Contents: Debris such as trees, concrete rubble, fencing, broken culvert piping, etc., from excavation of A1PI West and Area D for site railroad improvement

Total Volume: 680 yd^3

3.5 A1PI SEDIMENT TRAPS

There were three sediment traps located within A1PI, A1PIST-1, A1PIST-2, and A1PIST-3. The material that was used to construct the berms for all three originated from the sediment trap excavations prior to remedial excavation and certification. Figure 3-4, Area 1, Phase I Sediment Traps, shows the location of the remaining traps within A1PI (A1PIST-2 and A1PIST-3), including the location of the berms for each trap. A1PIST-1 was excavated during construction of OSDF Cell 1. CU A1P1ST-1 was certified in-place to reduce impact to the OSDF construction schedule. The berm materials in A1PIST-1 were considered impacted. The berm materials and contents of the trap were placed in the East Impacted Material Stockpile. Certification sampling and analysis testing were conducted on the

native soils beneath the berm materials for all ASCOCs. The results passed certification analysis and the analytical results are included in this report.

As part of the work scope of Area 1 Phase II, the remaining two sediment trap CUs, A1PIST-2 and A1PIST-3 (including the berm materials), will be sampled for certification. Following certification, the sediment traps will be graded for wetland mitigation. The volume of soil in the berms of the remaining sediment traps are approximately 1,120 yd^3 in A1PIST-2 and 1,140 yd^3 in A1PIST-3.

3.6 A1PI NAR CUs

The six CUs comprising the Old North Access Road (NAR) and ditches in A1PI (certification units NAR 1-6) were certified "in place" by taking waste acceptance criteria (WAC) and certification samples at depth and analyzing them as per previous agreement reached with the regulatory agencies. None of the samples indicated soil in the CUs was at or above the FRLs for ASCOCs. In order to remove artificial or imported media that can not be certified, a level of excavation into native material residing beneath the road fill is specified. When this road and fill material in CUs NAR 1-6 is excavated to the specified depth, certification of these CUs will be considered complete. Figure 3-5, Typical Cross Section of Excavation of Existing North Access Road, summarizes the methods used to excavate these areas to the certified depth. However, due to construction demands, completing excavation of the NAR CUs will be a phased process dictated by the OSDF construction schedule.

A northern section of approximately 350 feet of the NAR between the intersection of the new NAR and the northern perimeter of the OSDF has been left intact to provide support for the construction of the OSDF. It will be necessary to keep this unexcavated northern section of roadway intact until the completion of OSDF construction. Beginning at coordinate N 483445, E 1351342 approximately 1,300 feet of the NAR within the OSDF footprint (cells 1, 2 and half of cell 3) has been excavated to or beyond the specified certification depth. This excavated zone currently terminates at coordinates N 482175, E 1350928 which is approximately 250 feet north of the southern extreme of the A1PI NAR CUs. The southern (250') and northern (350') sections of the old NAR will not be considered certified until the artificial or imported materials have been excavated.

The remaining southern 250 foot section of certified in place old NAR will be excavated during July 1998 to accommodate the construction of the OSDF Cell 2 compacted clay liner. A separate

certification letter report for the southern section of the road will be submitted to the regulatory agencies after excavation to certification depth. The northern section of the old NAR will be transferred to Area 10, Corridors. Both the southern and northern sections will no longer be considered a portion of A1PI and are not included in this report. These portions of the ANR being excluded are depicted in Figure 3-6. The southern section of the road left in place is scheduled to be removed in June 1998. The northern section of the road left in place will be remediated with Area 10, as necessary.

The roadway south of A1PI has not been subjected to certification and WAC attainment sampling and will be addressed in the work scope detailed in the Certification Design Letter (CDL) for Area 1 Phase II, Sector 2. After in place certification and WAC attainment are completed, the remaining sections of the old NAR will be excavated sequentially to accommodate the construction of OSDF Cells 4, 5, 6, 7, and 8.

TABLE 3-1
A1PI SOIL VOLUMES

A1PI Area	FS Volumes (yd^3)	A1PI Designed Volumes (yd^3)	A1PI Actual Volumes (yd^3)
East*	24,880	30,000	34,700
West	4,760	4,760	5,700
Totals (without area of A1PIST-1, -2 and -3)	na	34,760	40,400
Totals (without area of A1PIST-1, -2 and -3; without 1,440 yd^3)	31,080	36,200	41,840

* The sediment traps installed within areas certified under A1PI have not been excavated at this time. The CUs associated with these sediment traps will be certified when the sediment traps are removed. All the material associated with each sediment trap will be placed in the OSDF. The volumes for the A1PI sediment traps do not include soil in the berms. The volumes of soil in A1PIST-2 and A1PIST-3 are 1,120 yd^3 and 1,140 yd^3 respectively.

SECTION 4.0
ANALYTICAL METHODOLOGIES, DATA VALIDATION PROCESSES, AND DATA REDUCTION

4.1 ANALYTICAL METHODOLOGIES

The samples for A1PI were analyzed at laboratories on the FEMP Approved Laboratories List per the Sitewide Quality Assurance Project Plan (SCQ). A laboratory must comply with SCQ requirements to be on the list. Furthermore, each laboratory was audited within one year of the analysis of A1PI samples. The SCQ is also the source for analytical methodologies, data validation and verification, and analytical and field quality assurance/quality control (QA/QC) requirements. All the samples in A1PI were analyzed and reported at Analytical Support Level (ASL) D. (Refer to the SCQ for more information on ASLs.) The reported data packages included sample results, associated QA/QC data, and all applicable raw data. A summary of the analytical methods follows.

4.1.1 Chemical Methods

Standard sample analytical methodologies were used. Samples were analyzed for inorganic ASCOCs using the EPA's Contract Laboratory Program (CLP) method ILMO3.1 or ILMO4.1, depending on the specific analytical task order requirements. Both methods are essentially the same in terms of analytical methodology; ILMO4.1 is the recently promulgated EPA method available for use by laboratories.

Samples were analyzed for PCBs using SW-846 method 8080 or CLP method OLMO3.1, depending on specific laboratory task order requirements. Both methods are equivalent regarding analytical quality methodologies and QA/QC requirements.

4.1.2 Radiochemical Methods

The radiological analytical methods depended on the specific nuclide of interest. Specific performance criteria were specified for each analyte in A1PI. This criteria included: Highest Allowable Minimum Detectable Concentrations (HAMDCs), percent overall tracer / chemical recovery, percent matrix spike recovery, method blank contamination, percent recovery for laboratory control samples, and percent recovery for duplicate samples. In order to meet these criteria the laboratories used to support A1PI used primarily two methodologies, alpha spectroscopy and gamma spectroscopy.

The alpha spectroscopy method consists of a chemical separation for the radionuclide of interest followed by alpha spectrometry counting. The measured values from this method were used for thorium-228, thorium 230, and thorium-232.

Gamma spectroscopy is a more direct method of analysis, in which the gamma radiation is measured from each sample. The presence of a radionuclide is based on the gamma radiation energies measured. This method was used for radium-226, radium-228, and cesium-137. This method was used to calculate the total uranium value, using the reported uranium-238 measurement. The calculation used was as follows:

Total Uranium (mg/kg) = (2.998544) x uranium-238 gamma spectroscopy result (pCi/g)

The validation qualifier assigned to the uranium-238 value was carried over to the total uranium value.

A1PI certification samples were analyzed for thorium-232 by two different methods; alpha spectrometry and gamma-ray spectrometry. Both are industry accepted methods for the analysis of Thorium-232 in soil. Alpha spectrometry analysis provides for the direct analysis of Thorium isotopes without the use of equilibrium assumptions. Gamma spectrometry, which is significantly less costly, uses the measurement of the gamma photons emitted by one or more Thorium-232 daughters to calculate an activity concentration based on an equilibrium assumption. For the purposes of thorium-228 and thorium-232 certification, alpha spectrometry, rather than gamma spectrometry, was used. The data used to calculate A1PI certification are included in Appendix B; other data collected during certification sampling, but not used to calculate certification (such as thorium-228 and thorium-232 gamma spectrometry results) are included in Appendix B.1.

Comparison of the individual results from A1PI indicates that those produced by gamma-ray spectrometry are generally higher than corresponding results generated by alpha spectrometry. Furthermore, statistical evaluation of the data sets for A1PI certification results identified 8 units that would slightly exceed the FRL for Thorium-232 at the 95% upper confidence limit on the mean based upon the gamma-ray spectrometry results. The FRL was exceeded in 7 of these units by less than 0.07 and by 0.36 in CU O20. Statistical analysis of the alpha spectrometry data for Thorium-232, however, identified that all certification units were less than the FRL at the 95% upper confidence limit. It was recognized that the source of the high bias associated with the gamma-ray spectrometry results relative to the alpha spectrometry results

could be due to a number of factors. The potential possibilities for the gamma-ray versus alpha spectrometry descrepancy included laboratory variability in gamma-ray spectrometry analyses (three contract laboratories were performing the analyses), a general high bias trend with gamma-ray spectrometry as compared to alpha spectrometry, or a laboratory-specific high bias due to the particular gamma-ray spectrometry approach (abundancies, photons and computational methods) which was being used. As a result of this descrepancy, its potential sources, and the FEMP's and, generally, contract laboratories familarity with alpha spectrometry, DOE made the decision to (1) report the A1PI certification results for thorium-232 in terms of alpha spectrometry and (2) continue to investigate the causes of the gamma-ray versus alpha spectrometry descrepancy.

The general trend toward higher results yielded by gamma-ray spectrometry versus alpha spectrometry for thorium-232 was identified during the compilation of the A1PI results and the development of a companion report evaluating the comparability of HPGe gamma-ray spectrometry measurements versus more traditional laboratory based gamma-ray measurements. An analysis was undertaken by the FEMP to attempt to understand the basis for this analytical phenomenon. While this analysis continues, recent evaluations have has highlighted the significance of the inherent variability in laboratory data, and methods, which is even more pronounced as the measured concentrations decrease toward the detection limit. Evaluation of individual samples measured for thorium-232 by both analytical methods at three commercial laboratories used to support A1PI certification indicated that gamma-ray spectroscopy results ranged from 13 to 17 percent higher than corresponding alpha measurements on the same samples. The FEMP attributes this variability to the uncertainty in the methods and to differences in analytical procedures and techniques between the three laboratories.

To begin to examine the origin of the variability, samples from CU O20 were submitted to a different lab for re-analysis by gamma spectrometry, in order to compare laboratory variability. The re-analysis indicated that the second laboratory's results varied by approximately 20% for the same samples using the same measurement techniques (gamma spectrometry). Further analysis indicated that each laboratory used different gamma photons, abundancies, and computational methods to quantify the thorium-232 results. While one method is not necessarily any better than another, the difference did lead to variability.

While evaluations continue to determine the necessary actions to minimize future variability in results, some preliminary lessons learned have been identified. First, a set of site-specific radiological standards will be developed by DOE's Environmental Measurements Laboratory for use as calibration standards or

check standards to be continually analyzed along with FEMP soil samples. Analysis of these standards will highlight future analytical variabilities or discrepancies. Second, analytical detection limits are being re-evaluated and specifications for more prescriptive analytical methods are being developed to be used consistently by all support or contract laboratories. The prescriptive methods will specify abundancies, which gamma photons are to be used for quantification, and specific computational methods.

4.2 DATA VERIFICATION AND VALIDATION

This section discusses the data verification and validation process (V&V) to examine field and laboratory data. Data were qualified to indicate the level of data usability, or level of confidence in the reported analytical results. The EPA's National Functional Guidelines for Data Review (Organic Data) and the National Functional Guidelines for Data Review (Inorganic Data) (EPA 1994), as adapted and approved by EPA Region V, were used for this process.

Specific parameters associated with the data were evaluated during V&V to determine if data quality objectives were met. Five principal quality assurance parameters, i.e., precision, accuracy, completeness, comparability, and representativeness, were addressed during V&V. Field sampling and handling, laboratory analysis and reporting, and nonconformances and discrepancies in the data were examined to ensure compliance with appropriate and applicable procedures.

The V&V process evaluated the following parameters:

- Specific Field Forms for sample collection and handling
- Chain of Custody forms
- Completeness of Laboratory Data Deliverable

The data validation process examined the analytical data to determine the level of confidence of the results. General areas examined that apply to all the chemical data include the following:

- Holding Times
- Instrument calibrations
- Calculation of results
- Matrix spike/matrix spike duplicate recoveries
- Laboratory/field duplicate precision
- Field/Laboratory Blank contamination
- Dry weight correction for solid samples
- Correct detection limits reported
- Laboratory Control Sample (LCS) recoveries and compliance with established limits

Specific areas of evaluation for organic PCB data include:

- Gas chromatographic quality of PCB target compounds
- Surrogate recoveries
- Internal or External Standard Area evaluations for PCB data
- Relative percent difference between initial and continuing calibration response and calibration factors

Parameters unique to inorganic analyses that were evaluated include:

- Graphite furnace atomic absorption (GFAA) post-digestion spike recoveries
- Inductively coupled plasma (ICP) and GFAA performance checks

Parameters unique to the evaluation of radiochemical analyses include:

- Calibration data for specific energies
- Background checks
- Relative Error ratios
- Tracer yields
- Detector efficiencies
- Background count correction

For A1PI, 90% of the data were validated at ASL B. This validation included a review of the data for all criteria noted above, and a cursory review of the raw data. Ten percent of the data were validated to ASL D. This validation included the same review process as for ASL B, but included a systematic review of the raw data and recalculations.

Following V&V, qualifier codes were applied to specific data points, reflecting the level of confidence assigned to the particular datum. These codes included:

-	No qualification; the positive result or detection limit is confident as reported.
J	Positive result is estimated or imprecise; data point is usable for decision-making purposes. Positive results less than the contract required reporting limit are also qualified in this manner.
R	Positive result or detection limit is considered unreliable- data point should NOT be used for decision-making purposes
U	Undetected result at the stated limit of detection; useable for decision-making purposes
UJ	Undetected result; detection limit is considered estimated or imprecise; useable for decision-making purposes
Z	This result, or detection limit in this analysis is not the best one to use; another analysis (e.g., the dilution or re-analysis) contains a more confident and usable result..

4.2.1 Results of the Data Validation Process

The qualification of all data for this project is summarized in Table 4-1, Evaluation of Data Qualifiers, which includes the total number of data points, the number qualified as Rejected (R), and the number qualified as Estimated (J or UJ). In general, the data validation process did not result in a significant amount of the data being qualified estimated or unusable. In every CU an adequate number of data points was available for statistical analysis. Table 4-2 summarizes the reasons for qualification of the inorganics, and Table 4-3 summarizes the reasons for the qualification of radiological ASCOCs.

4.3 DATA REDUCTION

The data set for A1PI Certification ASCOCs can be found in Appendix B, and in Appendix C for Ecological ASCOCs. Each sample used to support the A1PI certification decision was entered in the FEMP Sitewide Environmental Database (SED) with the following information.

Field Information

- Sample Identification Number - A unique number assigned to each discrete sample point.
- Sample Collection Date - Date the sample was collected in the field
- Coordinate Information - Northing and Easting locations.
- Certification Unit - Each sample is assigned to a CU based on location.

Laboratory Information

For each sample result the following information is entered:

- Laboratory Result - The reported analytical value from the laboratory.
- Laboratory Qualifier - The qualifier reported from the lab. For inorganic and organic data these qualifiers are consistent with the CLP Qualifiers. For radiological parameters non-detect values are assigned a U qualifier.
- Total Propagated Uncertainty (TPU) - This value represents the uncertainty associated with the reported result. TPU includes the counting error, as well as uncertainty from other laboratory measurements and data reduction. (Applicable to radiological parameters only)
- Units - The units in which the Laboratory Result is reported.

Validation Information

- Validation Result - The result based on the validation process. During the validation process, sample results may be adjusted. For example, if the laboratory result is less than the associated Minimum Detectable Concentration (MDC), the validation result becomes the MDC value.
- Validation TPU - The TPU based on the validation process.
- Validation Qualifier - The qualifier assigned as a result of the data validation process.
- Validation Units - The units in which the Validation Result is reported.

Using the information as summarized above, the following actions were taken for data reduction of each CU data set.

1. All the data for each CU was queried from SED. All the data was used even if the CU had more than the minimum required data points.
2. The data from the validation fields were used for statistics.
3. Data with a qualifier of R or Z was not used in the statistics.
4. Duplicate results were averaged, and the average result was used in the statistics.
5. One half of the non-detect (U or UJ) values were used in the statistics.

TABLE 4-1
EVALUATION OF DATA QUALIFIERS

Analyte	Method	Total Number of Points[a]	Number Qualified "R"	Number Qualified "J" or "UJ"
Total Uranium	calculation/gamma	653	0	196
Thorium-232	alpha	660	0	202
Thorium-228	alpha	660	0	231
Radium-226	gamma	668	0	74
Radium-228	gamma	659	0	46
Cesium-137	gamma	43	0	0

Arsenic	ILMO3.1 or ILM)4.1	409	0	124
Beryllium	ILMO3.1 or ILMO4.1	406	0	3
Aluminum	ILMO3.1 or ILMO4.1	485	0	40
Manganese	ILMO3.1 or ILMO4.1	495	16	228
Molybdenum	ILMO3.1 or ILMO4.1	485	0	116
Aroclor-1260	SW-846 8080	77	4	14

[a] If a sample was re-analyzed, both the original result and the re-analysis are included in this total.

TABLE 4-2
REASONS FOR QUALIFICATIONS OF INORGANIC / ORGANIC DATA

Analyte	Qualifier (s)	Primary Reasons for Qualification
Aluminium	J	• Serial Dilution imprecision. • Laboratory duplicate imprecision.
Arsenic	J / UJ	• Matrix Spike recoveries out of control. • Initial Calibration Check Standard (ICS) recovery low. • Field Duplicate RPD high
Beryllium	J / UJ	• Field Duplicate RPD high.
Manganese	R	• Matrix Spike recoveries were less than 30%. These samples were reanalyzed, and some recoveries remained below the acceptable limit.
Manganese	J	• Serial Dilution imprecision. • Matrix Spike recoveries out of control • Field duplicate RPD high. • Laboratory duplicate imprecision.
Molybdenum	J / UJ	• ICS recovery low.
Aroclor 1260	R	• Matrix Spike recoveries were out of control. These samples were reanalyzed. All reanalyses resulted in acceptable data..
Aroclor 1260	J / UJ	• Hold times were slightly exceeded.

TABLE 4-3
REASONS FOR QUALIFICATION OF RADIOLOGICAL DATA

Analyte	Qualifier (s)	Primary Reasons for Qualification
Radium 226	J / UJ	• Laboratory duplicate imprecision. • Field duplicate imprecision. • Calibration deficiency. • High background.
Radium -228	J / UJ	• Elevated TPU. • Calibration deficiency. • Laboratory blank contamination
Thorium-228	J / UJ	• Tracer yield out of control. • Laboratory duplicate imprecision. • Matrix Spike recovery out of control. • Laboratory blank contamination.
Thorium-230	J / UJ	• Tracer yield out of control. • Laboratory duplicate imprecision. • Matrix Spike recovery out of control. • Laboratory blank contamination.
Thorium-232	J / UJ	• Tracer yield out of control. • Laboratory duplicate imprecision. • Matrix Spike recovery out of control. • Laboratory blank contamination.
Total Uranium	J / UJ	• Elevated TPU. • Laboratory duplicate imprecision. • Laboratory blank contamination.
Cesium-137	J / UJ	• Elevated TPU. • Laboratory duplicate imprecision.

SECTION 5.0
CERTIFICATION RESULTS AND CONCLUSIONS

The current pass/fail certification results for A1PI CUs are summarized in Table 5-1, Area 1 Phase I Certification Results. The determination of successful certification or certification failure was based on a review of certification sample data from each CU against criteria discussed in Section 2.5. As indicated in Table 5-1, all the CUs in A1PI have passed certification. CUs O20, Q18-40, and P17-32 required additional corrective actions to attain the final certification criteria.

Initially, some CUs failed certification based upon the statistical analyses discussed in Section 2.5. Note that the certification criteria are specific to A1PI; criteria for all other areas are defined in the SEP. Additional corrective actions aside from the designed excavation were taken for any CU that did not pass initial certification. Corrective actions included: collection of additional samples, and re-excavation of soil in the entire CU, or portions of a CU, to a sufficient depth that the CU under question passed certification. Each CU was re-certified for the COC(s) for which it had initially failed. A discussion of the CUs which required corrective actions to complete certification is included in Section 5.3.

5.1 FRLs RELATIVE TO THE UCLs

All CUs passed final FRL certification relative to the average concentration of COCs in residual A1PI soils. Additionally, the total uranium ALARA goal of 50 mg/kg in residual soils was not an issue in A1PI. Three CUs required additional corrective actions; i.e., excavation of more than the designed six inches, or additional sampling, to pass FRL certification analyses. These CUs were Q18-40 for radium-226, P17-32 for arsenic, and O20 for radium-228.

5.1.1 Q18-40 Radium-226

Twelve certification samples were collected and analyzed for primary radiological COCs in CU Q18-40 after the CU had been initially excavated. Of the 12 sample results, 3 were above the radium-226 FRL of 1.7 mg/kg. The original certification sample locations and results for radium-226 within Q18-40 are depicted in Figure 5-1, Original Radium-226 Certification Results in Q18-40. CU Q18-40 initially failed FRL certification for radium-226 based on statistical analysis, with an upper confidence limit of 1.80 pCi/g, and a probability of 13.5% that the mean concentration is above the radium-226 FRL.

These results are shown in Table 5-2, Radium-226 Certification Results and Statistics in Q18-40 Before Corrective Action. Corrective actions taken for this CU are discussed in Section 5.3.

5.1.2 P17-32 Arsenic

Fourteen certification samples were collected in CU P17-32, and analyzed for inorganic COCs. Of the 14 sample results, 7 were above the arsenic FRL of 12 mg/kg. The original certification sample locations and results for arsenic within P17-32 are depicted in Figure 5-2, Original Arsenic Certification Results in P17-32. CU P17-32 failed certification for arsenic based on statistical analysis, with an upper confidence limit of 13.05 mg/kg, and a probability of 41.1% that the mean concentration is above the FRL. These results are shown in Table 5-3, Arsenic Certification Results and Statistics in CU P17-32 Before Corrective Action. Corrective action taken for this CU is discussed in Section 5.3.

5.1.3 O20 Radium-228

Twelve certification samples were collected in CU O20 and analyzed for primary radiological COCs. Five of the 12 results for radium-228 were above the 1.8 pCi/g FRL. The original certification sample locations and results for radium-228 are depicted in Figure 5-3, Original Radium-228 Certification Results in O20. CU O20 failed the certification for radium-228 with a UCL of 1.86 pCi/g, and a probability of 11.6% that the mean concentration is above the FRL. The statistical analysis is shown in Table 5-4, Radium-228 Certification Results and Statistics in CU O20 Before Corrective Action. The corrective action taken for this CU is discussed in Section 5.3.

5.2 HOT SPOT DETERMINATION

All CUs passed final certification relative to the "hot spot" criterion of COCs in residual soils of A1PI. Only CU O20 for total uranium required an additional corrective action to pass the A1PI "hot spot" criterion of 2 x FRL.

5.2.1 O20 Total Uranium

Based upon the certification sample results, CU O20 failed certification for total uranium due to a concentration of 205.4 mg/kg in a single sample point compared with the 2 x FRL criterion of 164 mg/kg. The original certification sample locations and results for total uranium within O20 are depicted in Figure 5-4, Original Total Uranium Results in O20. The O20 total uranium original certification sample results and statistics are summarized in Table 5-5, Total Uranium Certification

Results And Statistics O20 Before Corrective Action. Corrective action taken for this CU is discussed in Section 5.3.

5.3 ADDITIONAL CORRECTIVE ACTIONS FOR FAILING CUs

5.3.1 Q18-40 Radium-226 Corrective Action

As a result of the initial certification failure for radium-226 in CU Q18-40, the following actions were taken as agreed upon with the regulatory agencies. Since the original certification results demonstrated that the area of contamination appeared to be primarily located in the southern portion of the CU, the CU was divided into two new CUs. The 482825 northing coordinate line was used to bisect the CU. The northern CU was labeled Q18-40A, and the southern CU was labeled Q18-40B. The two CUs were then divided into 16 sub-CUs, as shown in Figure 5-5, New CUs Q18-40A and Q18-40B and Systematic Random Sampling Locations within Each. The plan to determine the depth of regional excavation required to remove contaminated radium-226 soil for Q18-40A and Q18-40B is discussed in Sections 5.3.2 and 5.3.3, respectively.

5.3.2 Q18-40A

In Q18-40A, five original Q18-40 sample locations and their radium-226 results were retained for radium-226 certification results. These locations are #2, #5, #8, #9, and #11 in Figure 5-1, and #6, #14, #7, #15, and #4 in Q18-40A in Figure 5-5. These sample locations and their analytical laboratory results serve as the radium-226 results for each of their respective subunits. Sample locations were randomly selected in the other 11 subunits in Q18-40; these are shown in Figure 5-5.

Using the Geoprobe® Technique, soil core samples were collected in 6 inch intervals at the 16 locations to a depth of 24 inches in Q18-40A (see Figure 5-5). For the initial five sample locations, the 6-12 inch interval was submitted for analysis, and the 12-18 inch and 18-24 inch intervals were archived. The other 11 locations were sampled at both the 0-6 inches and the 6-12 inch intervals, and samples were submitted for radium-226 analysis. The 12-18 and 18-24 inch intervals were archived. Based upon the statistical evaluation of the radium-226 data shown in Table 5-6, Q18-40A Post Corrective Action 0-6 inch and 6-12 inch Radium-226 Statistics, Q18-40A passed certification analyses at the 0-6 inch interval. This evaluation was completed using the original 5 sample points and the additional 11 samples. No further corrective action is necessary. Furthermore, the 6-12 inch interval also passed certification and this data is also presented in Table 5-6.

5.3.3 Q18-40B

Using the Geoprobe® Technique, a soil core was collected to a depth of 24 inches at each of the 16 random points within Q18-40B. The cores were divided into 4 discrete 6-inch increments. Except for WAC attainment samples submitted for total uranium analysis, the 0-6 inch samples were discarded, since this increment was removed due to demonstrated radium-226 contamination.

The 6-12 inch and 12-18 inch intervals were collected and analyzed for radium-226, and the 18-24 inch intervals were archived. Based on statistical evaluation of the radium-226 data shown in Table 5-7, Q18-40B Post Corrective Action 6-12 inch and 12-18 inch Radium-226 Statistics, Q18-40B passed certification analyses at the 6-12 inch interval. Furthermore, the 12-18 inch interval also passed certification and these data are also presented in Table 5-7. Based on these results, the excavation was limited to 6 inches as shown in Figure 5-6, Q18-40 Re-excavation.

A review of the data collected from CUs Q18-40A and Q18-40B was conducted to determine if the corrective action was sufficient for certification of the area. Review of the average concentrations does show a slight increase at depth for CU Q18-40A, but a decrease for CU Q18-40B. For the background data set, the 95th percentile for radium-226 is 1.42 pCi/g. The concentrations measured in these CUs are all within the background levels and the analytical uncertainties. Therefore, these data do not raise the question that the radium-226 contamination in the area came from another source than air deposition. No further corrective action is necessary.

5.3.4 P17-32 Arsenic Corrective Action

An additional six inches of surface soil was removed from CU P17-32 to address the certification failure for arsenic. The following plan was used to determine the depth of regional excavation required to remove soil contaminated with arsenic exceeding the FRL.

P17-32 was re-divided into 16 sub-units, and a random sampling location was selected within each sub-CU as shown in Figure 5-7, Random Sample Points in CU P17-32. Using the Geoprobe® Technique, a soil core was collected to a depth of 24 inches at each of the 16 random points. The cores were divided into four discrete six-inch increments. Except for WAC attainment samples submitted for total uranium analysis, the 0-6 inch samples were discarded, since this increment was removed due to

demonstrated arsenic contamination. The 6-12 inch, 12-18 inch and 18-24 inch samples were analyzed as follows:

- All 16 of the 6-12 inch delineation increments were analyzed using the graphite furnace atomic adsorption method.
- Had the 6-12 inch sample results shown arsenic concentrations above the FRL, the 12-18 inch delineation increments would have been analyzed.

When results from a delineation increment revealed no arsenic contamination, the archived certification portions of that increment were validated and used as the P17-32 arsenic certification data. Based upon the statistical evaluation of the arsenic data shown in Table 5-8, P17-32 Post-Excavation Arsenic Statistics, P17-32 passed certification analyses at the 6-12 inch interval. The 0-6 inch interval across the entire P17-32 CU was excavated.

Prior to corrective action excavation of 0.5 feet (0-6 inches) from CU P17-32, a pre-excavation survey was conducted at 30 survey control points. Unfortunately, the CU was regraded immediately after excavation of the 0.5 feet and prior to conducting the post-excavation control survey. Calculations of removed soil volume were conducted at 0.869 feet compared to the commitment of 0.5 feet. If 0.5 feet were excavated from across the CU, approximately 394 yd^3 of soil would be generated. Approximately 704 yd^3 were actually generated during the excavation process (based on the 0.869 feet average excavation depth). In summary, after post-excavation re-grading, 9 of the 30 locations showed less than 0.5 feet of excavation, 21 of the 30 exhibited greater than or equal to 0.5 feet, and 15 of the 30 exhibited over 1.0 feet of excavation. Therefore, the commitment to remove 0.5 ft or 6" of soil across CU P17-32 was exceeded by approximately 70%.

5.3.5 O20 Corrective Actions

In O20, the statistical analysis of the original certification samples indicated that CU O20 failed both the average concentration criterion, and the hot spot criterion of 2 x FRL. For radium-228, the UCL of 1.86 pCi/g exceeded the FRL of 1.8 pCi/g, and a single total uranium result of 205.4 mg/kg exceeded the A1PI 2 x FRL criterion of 164 mg/kg (FRL = 82 mg/kg).

Hot Spot Failure

The O20 hot spot area was initially delineated with HPGe detectors to aid in the corrective action sampling design. The existing analytical and HPGe data obtained in CU O20 was kriged to illustrate the probabilistic lateral and vertical extent of the total uranium contamination at the identified hot spot and immediate surroundings. Based on this kriging, sample points in O20 were selected to bound the surface and subsurface extent of total uranium in the area of potential influence around the hot spot. The model indicated a surface contamination condition (i.e., a greater area of probable total uranium contamination present in the surface soil layer). Several strategic sample points close to the hot spot were chosen to gain adequate surface and subsurface delineation data to design the corrective action excavation. Additional sample points were selected away from the hot spot to collect surface data to further bound the extent of surface contamination. The combined data points are shown in Figure 5-9. The corrective actions that were taken to address the total uranium hot spot are summarized below:

- In order to confirm the area of contamination, physical samples were collected at twelve sample locations to delineate the extent of contaminated soil. Figure 5-9, Sampling Locations in O-20, shows the locations of the samples. One location was at the hot spot (#1 in Figure 9), nine locations were used to bound the area (#2, #4, #5, #6, #7, #8, #9, #10, #11), and two locations were within the bounded area (#3, #12). Table 5-9, CU O20 Sample Locations, shows the sample identification number and the depths that were analyzed. The samples were collected and submitted for total uranium analysis.

- Figure 5-10, O20 Total Uranium Concentration 0"-6" Interval, shows the results from the top interval. Figure 5-11, O20 Total Uranium Concentration 6"-12" Interval, shows the results of the next interval, and Figure 5-12, O20 Total Uranium Concentration 12"-18" Interval, shows the results of the lowest interval. Since contamination above the FRL was seen at the 6" - 12" interval at the hot spot, and no contamination at the 12"-18" interval the depth of excavation was set at 12 inches.

- During actual excavation a radiological technician used a Geiger Moeller Beta/Gamma detector during excavation to ensure complete removal of the contamination. This resulted in a localized 3' x 5'area that was excavated, as shown in Figure 5-13, O20 Hot Spot Excavation.

- After the area was excavated, four confirmatory samples were taken in the area of the original hot spot. The total uranium results for these confirmatory samples were 4 mg/kg, 3 mg/kg, 6 mg/kg, and 35 mg/kg. Since all of these values are well below the FRL, another certification sample was taken at the hot spot location and submitted for analysis. The total uranium result for this sample was 12.8 mg/kg, demonstrating that the hot spot had been removed. The statistics for total uranium were recalculated using this result, and are presented in Appendix B.

Radium-228 Failure

The FRL for radium-228 is 1.8 pCi/g and the mean concentration found in O20 from the original certification samples was 1.65 pCi/g with a standard deviation of 0.42. However, the UCL was 1.86 pCi/g, with a probability of 11.6% that the mean concentration is above the FRL. The highest single value was 2.46 pCi/g. Given that the mean concentration was below the FRL, this failure was a result of variance within the data set. The strategy to address this failure was to collect additional samples to increase the confidence level. Seven additional random samples were obtained to supplement the existing 12 samples. The sampling and analysis was performed and the UCL on the mean met the FRL when the additional sample data were integrated. The following corrective actions were taken:

- The CU was divided into 16 sub-CUs using the process described in Section 2.4.1.
- If a sample was not already located in the subunit, a sample location was randomly selected within that subunit. This resulted in 7 additional samples being taken in O20. See Figure 5-14, O20 Radium-228 Sample Locations.
- Using the additional samples the statistics were recalculated, which indicated that radium-228 in O20 meets the FRL criteria. Table 5-10, Radium-228 Statistics in O20 after Corrective Action, presents this data. No further action is necessary.

Additional samples will be collected north of CU O20 during the Area 9, Phase I off-property certification process. The locations of the samples will be detailed in the Area 9, Phase I Certification Design Letter.

5.4 NORTH ACCESS ROAD FILL CERTIFICATION

The soil beneath the north access road was certified in place (in CUs NAR-3 and NAR-4) through the pavement, the macadam and compacted fill material underlying the road. WAC attainment samples were collected from the first 6-inch interval of the compacted clay fill material, and the next 6-inch interval of compacted clay fill material was archived for possible WAC attainment analysis. Certification samples were collected and submitted for analysis when "native clay material" was encountered. Generally, "native clay material" was found between 17 and 21 inches below the road surface.

Prior to the certification sampling of NAR-4, the depth to the "native clay material" was estimated to be up to 70 inches below surface in the northern portion of the CU, as shown in Figure 5-15, North Access Road Fill. This portion of the existing North Access Road will not be impacted by the

relocation, as shown in Figure 5-16, NAR-4 and Planned Relocated North Access Road. Concern was expressed about the integrity of this large thickness of compacted fill material relative to soil FRLs and the 2 x FRL hot spot criterion. DOE prefers to avoid excavating this area of the existing North Access Road to prevent placement of clean material into the OSDF. Therefore, DOE proposed a strategy to collect certification analysis data for the compacted clay fill material in this portion of NAR-4 to make a certification determination. The strategy consisted of collecting additional certification samples from every 6-inch interval of compacted clay fill material encountered between the WAC attainment archive sample and the native clay material. The samples collected in the compacted clay fill material for certification analysis are summarized in Table 5-11, NAR-4 Certification Samples. The determination for certification pass/fail for this material was conducted independently of the certification samples collected from "native clay material" for NAR-4. The same methodology of certification analyses as discussed in Section 2.5 was applied to the compacted clay fill material.

Based upon on the analytical data collected from the certification samples in the compacted clay fill, it was determined that the fill under the northern portion of NAR-4 is not contaminated, and it passed certification analyses, relative to the average residual soil concentration of COCs, within the established confidence intervals relative to the soil FRLs and according to the A1PI hot spot criterion of 2 x FRL. Appendix A includes statistical analyses of these data from NAR-4 for primary radiological COCs and secondary COCs. Therefore, the compacted clay fill material can be left in place, and excavation of the portion of the North Access Road that is planned to be left in place is unnecessary.

5.5 A1PI CERTIFICATION CONCLUSIONS

All of the CUs in A1PI have passed certification testing analyses relative to the determination of average residual soil concentrations within applicable confidence bounds (except for O20 for radium-228 and Q18-40 for Radium-226, which are pending), and relative to the 2 x FRL "hot spot" criterion implemented in A1PI. Corrective actions were implemented for any CU that failed initial certification analyses. Final certification data are presented in Appendix A.

Based on these results, DOE requests concurrence that the remedial actions conducted in A1PI have successfully attained the FRLs consistent with the approach described in this document. Except for the excavation of the two remaining portions of the NAR, remedial objectives in the OU5 ROD have been achieved and no further remedial actions are warranted in A1PI. A separate certification letter report

will be submitted for review and approval for the remaining southern section of the NAR. The northern section will be transferred to Area 10. The remaining sediment traps in A1PI will be certified during remedial activities in Area 1 Phase II. Following certification of the sediment traps, these areas will be regraded in support of wetland mitigation. Final land use in A1PI has been initiated and includes construction of the northern portion of the OSDF and related infrastructure, placement of the relocated North Access Road, and construction of miscellaneous support facilities.

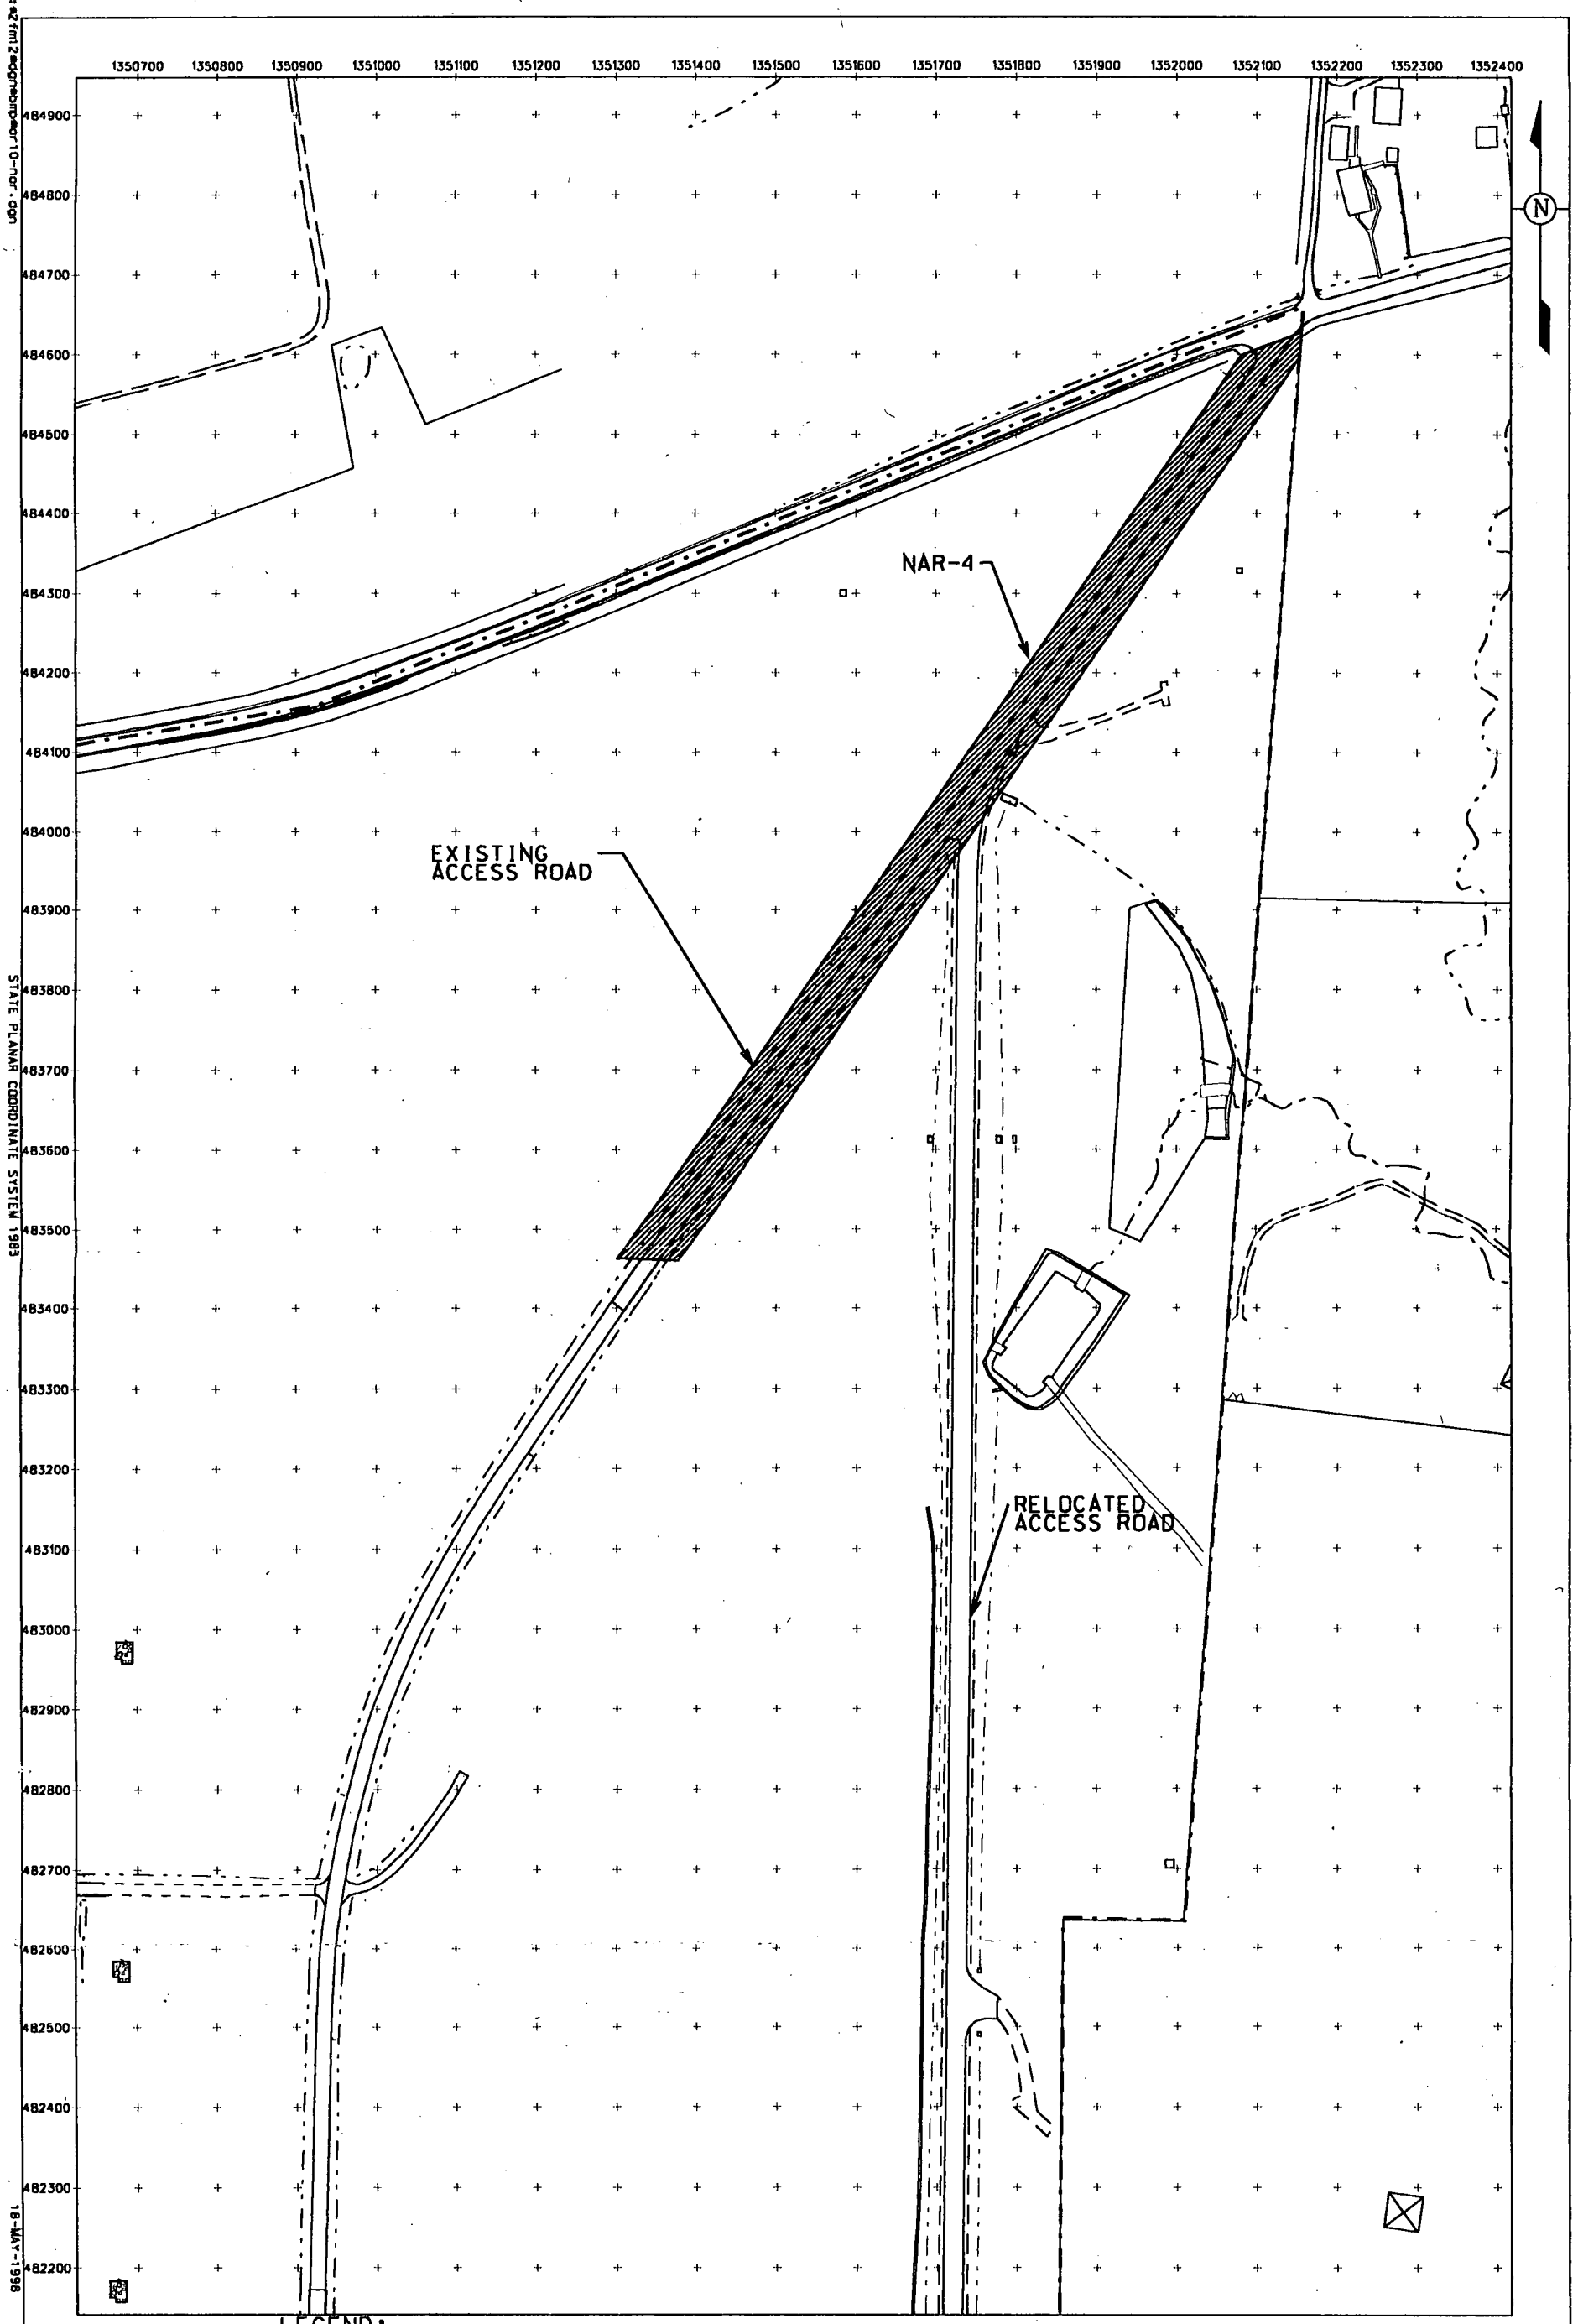

FIGURE 5-16. NAR-4 AND PLANNED RELOCATED NORTH ACCESS ROAD

SECTION 6.0
ACCESS TO CERTIFIED AREAS

DOE has restricted access to the certified areas in order to maintain their integrity prior to transferral for final land use. A FEMP procedure (EP-0008) implements a process to protect certified areas from becoming re-contaminated. The process for A1PI was as follows:

- At the initiation of certification sampling activities for the area, temporary fencing was installed to delineate the boundaries of the area to be certified.
- Signs were posted on the temporary perimeter fencing where access approval for entry into the area was required.
- The access to the now certified A1PI area is further controlled by requiring written authorization from the responsible project manager to gain access.
- Any equipment that has been used on-site off-road or in a controlled area must be decontaminated using a pressure washer before it is used in a certified area; or for any intrusive work, before entry into the certified area.
- FEMP management team representatives will instruct general employees/operators on the entry and exit requirements for this area.

Since this area has been certified, it will be transferred to final land use. Until such time, best management practices and administrative controls will be used to protect the area from contamination, and other controls will be implemented as needed.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

NOTE: Rejected data (qualified "R") was not used in the calculations. One half of the reported detection level was used in the calculations for results reported as below the detection limit (qualified with "U"). Duplicates were averaged before calculations were performed.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

NOTE: One half of the reported detection level was used in the calculations for results reported as below the detection limit (qualified with "U"). Duplicates were averaged before calculations were performed.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

	2 x (P/F)	Pass	Pass	Pass	Pass	Pass	-	-

NOTE: One half of the reported detection level was used in the calculations for results reported as below the detection limit (qualified with "U"). Duplicates were averaged before calculations were performed.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

Pass/Fail	**Pass**	**Pass**	**Pass**	**Pass**	**Pass**
2 x (P/F)	**Pass**	**Pass**	**Pass**	**Pass**	**Pass**

NOTE: One half of the reported detection level was used in the calculations for results reported as below the detection limit (qualified with "U"). Duplicates were averaged before calculations were performed.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.
2 x (P/F) - Pass or Fail of the "No exceedances of twice the FRL" criteria.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

NOTE: One half of the reported detection level was used in the calculations for results reported as below the detection limit (qualified with "U"). Duplicates were averaged before calculations were performed.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

KEY

FRL - Final Remedial Level

Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.

Background 95% - 95th Percentile of the background dataset.

Samples - Number of distinct sample locations in the analysis (see NOTE above).

Hits - Analyte positively detected in the sample.

Max - The maximum sample result.

Mean - The mean or average concentration. (See NOTE above).

St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).

UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.

t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).

Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.

Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

KEY
FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

KEY

FRL - Final Remedial Level
Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.
Background 95% - 95th Percentile of the background dataset.
Samples - Number of distinct sample locations in the analysis (see NOTE above).
Hits - Analyte positively detected in the sample.
Max - The maximum sample result.
Mean - The mean or average concentration. (See NOTE above).
St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).
UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.
t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).
Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.
Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

	Pass/Fail	Pass	Pass	Pass	--	--	--	--

NOTE: One half of the reported detection level was used in the calculations for results reported as below the detection limit (qualified with "U"). Duplicates were averaged before calculations were performed.

KEY

FRL - Final Remedial Level

Background UCL - Upper Confidence Level (95% one-sided) on the Mean Background concentration.

Background 95% - 95th Percentile of the background dataset.

Samples - Number of distinct sample locations in the analysis (see NOTE above).

Hits - Analyte positively detected in the sample.

Max - The maximum sample result.

Mean - The mean or average concentration. (See NOTE above).

St.Dev. - The standard deviation of the sample concentrations. (See NOTE above).

UCL - Upper Confidence Level (95% one-sided) on the Mean concentration.

t-Stat - The calculated t-statistic for the mean concentration compared to the FRL. (See the Certification Report).

Prob. - The probability (based on the t-Stat) that the true CU mean exceeds the FRL. Acceptable probability for primary COCs is 5% and 10% for seconday COCs.

Pass/Fail - Pass or Fail result from the t-Test based on "t-Stat" above. The associated probability is "Prob." above.

Appendix B

Certification Data Summary Tables

APPENDIX B - DATA SUMMARY TABLES
A1PI CERTIFICATION REPORT
KEY AND EXAMPLE CALCULATION

This Appendix contains all the data used to support the statistics presented in Appendix A. The following is a key and brief description of the fields presented in this Appendix.

CU Name The name of the Certification Unit as described in Section 2.0. There are 81 CUs including Q18-40A and Q18-40B. The Appendix is sorted by CU Name.

Parameter This field lists the COC. The COCs presented in this Appendix include: aroclor-1260, arsenic, beryllium, cesium-137, total uranium, radium-226, radium-228, thorium-228, thorium-230, and thorium-232. Presented in Appendix C are the ecological COCs: aluminum, manganese, molybdenum.

CU Type This field lists the type of CU, and where this data is presented in Appendix A. For example, A1PIST-1 arsenic results are presented in the A1PIST-1 metals CU, while A1PIST-1 radium-226 results are presented in the radiological CU.

Sample ID The unique number assigned to each discrete sample point in the field.

Suffix For some results multiple analytical runs were performed in accordance with the analytical requirements. For example, if the original run of the sample shows a matrix problem, the sample is re-run. Both the original analysis and the re-run are reported and presented in Appendix B. In the case noted above, the original run would have a suffix of "None" while the re-analysis would have a suffix of "RE." During the validation process the best sample result is determined, and a validation qualifier is added to both sets of data to cue the user which result to use. One result is either rejected (R) or marked as (Z).

Northing The Northing coordinate, which allows the user the map the data with the Easting coordinate.

Easting The Easting coordinate, which allows the used to map the data with the Northing coordinate.

Sample Date The sample collection date in the field.

Lab Result The actual analytical value reported by the laboratory.

Lab TPU Total Propagated Uncertainty (TPU). This value represents the uncertainty associated with the reported result. TPU includes the counting error, as well as uncertainty from other laboratory measurements and data reduction. (Applicable to radiological parameters only)

Qualifier The qualifier reported from the lab. For inorganic and organic data these qualifiers are consistent with the CLP Qualifiers. For radiological parameters non-detect values are assigned a U qualifier.

Lab Units The units in which the Laboratory Result is reported.

Val. Result The result based on the validation process. During the validation process, sample results may be adjusted. For example, if the laboratory result is less than the associated Minimum Detectable Concentration (MDC), the validation result becomes the MDC value.

Lab TPU Validation TPU - The TPU based on the validation process.

Qualifier Validation Qualifier - The qualifier assigned as a result of the data validation process. The following qualifiers may be assigned to the data:

- \- No qualification; the positive result or detection limit is confident as reported.
- **J** Positive result is estimated or imprecise; data point is usable for decision-making purposes. Positive results less than the contract required reporting limit are also qualified in this manner.
- **R** Positive result or detection limit is considered unreliable - data point should NOT be used for decision-making purposes
- **U** Undetected result at the stated limit of detection; useable for decision-making purposes
- **UJ** Undetected result; detection limit is considered estimated or imprecise; useable for decision-making purposes
- **Z** This result, or detection limit in this analysis is not the best one to use; another analysis (e.g., the dilution or re-analysis) contains a more confident and usable result.

Units The units corresponding to the validation result.

Duplicate of The sample number of which this result is a duplicate of. These are field duplicate results.

000299

EXAMPLE CALCULATION

The data presented in this Appendix requires various data reduction steps in order to calculate the statistics used for certification as presented in Appendix A. The following is an example of the data reduction process for CU Q18-40 for total uranium. The following table will be used to describe the process. Note that all the columns in the table can be found in Appendix B, with the exception of G and N. The "MDC" (Minimum Detectable Concentration) data (Column G) is part of the data package as reported from the laboratory, and "Value for Stats" (Column N) is part of the statistics data reduction.

			Laboratory Data				Validation Data			Total Uranium Data			Value
Sample ID	Suffix	Parameter	Result	Units	Qualifier	MDC	Result	Qualifier	Units	Result	Units	Qualifier	for Stats

DATA REDUCTION PROCESS

1. The laboratory reports the data in columns D, E, F, and G. In this example the parameter is uranium-238, which is used to calculate total uranium. Note that the "U" qualifier (non-detect) is assigned to all the results except Q18-40C-914679.

2. The laboratory data is then evaluated during the data validation process, and the validators then provide columns H, I, and J. Note that the validation results are different than the validation result. For each radionuclide the laboratory reports the measured activity (result) and the associated MDC. The MDC can be considered as the limit of detection, which is sample specific and is provided in the data package. For A1PI the analytical contractual requirements set the Highest Allowable Minimum Detectable Concentration (HAMDC) as one-half the FRL, except uranium-238 (used to calculate total uranium) which was set at 8 pCi/g. Also, the contractual requirements dictated that when the measured activity for a sample was below the sample MDC, the laboratory reported the measurement activity (not the MDC) as the result. During the validation process, the result was adjusted to the MDC, which

000300

accounts for the difference. For example, in sample Q18-40C-811654 the reported laboratory result for uranium-238 is 2.57 pCi/g, however the MDC is 3.9 pCi/g. Therefore the validators adjusted the result to the MDC.

3. In A1PI, the total uranium value was calculated from the gamma uranium-238 measurement using the following formula:

   Total Uranium (mg/kg)= 2.998544 x gamma uranium-238 measurement (pCi/g).

   For example, in sample Q18-40C-811654 the total uranium result is 11.7 ug/kg, which is calculated from the validation result of 3.9 pCi/g. The data qualifier from uranium-238 data is carried over and assigned to the total uranium result. This information is provided in Columns K, L, and M. Also note that since the total uranium value is a calculated result from the uranium-238 result, in Appendix A the laboratory fields are marked as N/A.

4. In order to calculate the certification statistics the following actions are taken:
   a. For the statistics the validated data is used, not the laboratory data.
   b. If multiple analyses are available as a result of re-runs (results will have different suffix codes) the validation qualifiers are used to determine the best value.
   c. One-half of the reported value is used for non-detects (U). For example, for sample Q18-40C-811654 the value used for the statistics is 5.8 ug/kg.
   d. Duplicate samples are averaged. For example, for sample Q18-40C-977977 a field duplicate (Q18-40C-977977-D) is also reported. The value used for the statistics is the average of these two numbers.

Response to USEPA and OEPA Comments on the
A1PI Certification Report

RESPONSES TO US EPA COMMENTS ON AREA 1 PHASE I CERTIFICATION REPORT FERNALD ENVIRONMENTAL MANAGEMENT PROJECT

GENERAL COMMENTS

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Not Applicable (NA) Page #: NA Line #: NA
Original General Comment #: 1

Comment: The certification report concludes that analytical results for most of the tested certification units (CU) are within the limits specified as final remediation levels (FRL). The only exception to this conclusion involves discrepancies between the results of the thorium-232 analyses by alpha spectrometry and those by gamma spectrometry, which are discussed in more detail in Original Specific Comment 2. Analytical results for eight CUs are greater than the FRL by gamma spectrometry but less than the FRL by alpha spectrometry. Acceptance of these results as being within the FRLs should be deferred until this alpha and gamma spectrometry methodological issue is resolved in the letter report discussed on Line 4 of Page 4-3.

Response:

Agreed. The draft Area 1 Phase I (A1PI) Certification Report acknowledged the discrepancy between the alpha spectrometry and gamma spectrometry results and proposed submitting a letter report to the United States Environmental Protection Agency (U.S. EPA) to clarify and resolve the discrepancies. Since the submittal of the A1PI Certification Report on July 1, 1997 to the EPA, a much better understanding of the reasons for the discrepancies has been gained. Furthermore, through the Real-Time Work Group Meetings, numerous discussions between FEMP representatives and representatives from the U.S. EPA and the Ohio Environmental Protection Agency (OEPA) have been held on gamma spectrometry methodology to better standardize the spectrometry process and to more accurately determine thorium-232 concentrations. These discussions have lead to a much better understanding of the reasons for the discrepancies as well as the path forward to help prevent or eliminate such discrepancies in the future. The discussion below provides the reasons for the discrepancies and the steps or procedures which have been put in place to resolve the discrepancies in the future. This discussion is intended to replace the letter report proposed in the draft certification report.

There was a discrepancy between the alpha and gamma spectrometry results presented in the A1PI Certification Report because the alpha spectrometry results for thorium-232 were, on average, statistically lower than their corresponding gamma spectrometry results. As a result, in some of the certification units (CUs), this statistically significant difference meant some of the CUs failed certification by gamma spectrometry but not by alpha spectrometry. These thorium-232-based analytical discrepancies occurred in eight CUs: (1) Q18-40, (2) Q19-10, (3) P18-40, (4) P20-30, (5) P17-22, (6) P17-32, (7) O19, and (8) O20. Following discussions with the EPA and evaluation of the conflicting A1PI certification results (alpha versus gamma discrepancies, gamma spectrometry results higher than alpha spectrometry results; and inter-

laboratory variability and bias between gamma spectrometry results), the EPA agreed to the DOE's recommendation to only report the alpha spectrometry results in the revised A1PI certification report.

The factors which caused varying degrees of alpha versus gamma discrepancies are as follows:

(1) The analysis of A1PI certification samples via two different analytical methods: alpha spectrometry and gamma spectrometry. Different analytical methods will, even under the best circumstances, produce different results.

(2) The laboratory analyses of the A1PI certification samples were conducted at three different off-site laboratories (EPI, Acculabs, and Thermo-Nutech or TNU). Confirmatory analyses were also performed at the FEMP laboratory. Given the same analytical method and procedure, different laboratories will often achieve different results.

(3) The small relative difference between the final remediation level (FRL) in soil and the FEMP background concentration for thorium-232 in soil. The FRL is 1.5 picocuries (pCi) per gram of soil; while, the 95th percentile of the background concentration for thorium-232 at the FEMP is 1.36.

(4) An analytical bias and lack of standardization in the gamma spectrometry method used to determine the thorium-232 concentrations. Each of the A1PI certification laboratories (outlined in item one above) utilized a biased and different method of evaluating the spectra and determining the thorium-232 concentrations.

Certification sampling results from Area 1, Phase II (A1PII) indicate that the primary contributors to these discrepancies (which lead to the false failure of the eight CUs in A1PI by gamma spectrometry) were an analytical bias and a high variability in the gamma spectrometry methodology. The high variability resulted from a lack of standardization in the gamma spectrometry methodology among the three commercial laboratories. Through the Real-Time Work Group discussions, a refined gamma spectrometry methodology for thorium-232 was established which standardized the process that the commercial laboratories would be required to follow. Through these Real-Time Work Group Meetings, it was established that the preferred thorium-232 gamma spectrometry analysis procedure should consist of using four energy lines, namely those from actinium-228, thallium-208, and lead-212, and performing an error-weighted analysis to determine the thorium-232 concentration (described in the DOE Letter, from Johnny Reising to James Saric and Tom Schneider, dated November 20, 1997).

The lack of standardization in the gamma spectrometry methodology created an inter-laboratory variability in gamma spectrometry results. Each laboratory selected a different photon energy peak from the thorium-232 daughter products to measure the thorium-232 concentration (sometimes only one photon peak was utilized other times multiple peaks were used). In some cases, a high gamma spectrometry bias was also introduced. From reviewing the A1PI certification results, the FEMP was able to determine that the high gamma spectrometry bias was partially due to the spectrometrist using only a single gamma energy line to determine the

concentration of thorium-232 (there is a significant difference between using a error weighted average and using a single gamma photon energy because an error weighted approach reduces variability). This created a high relative bias between gamma spectrometry analyses. Separate and additional variability and bias can occur between the comparison of gamma spectrometry and alpha spectrometry. In general, alpha spectrometry tends to produce lower values than gamma spectrometry.

Action:

In order to help ensure that similar discrepancies do not occur in the future, the FEMP has instituted the following actions:

(1) Utilize a single analytical procedure for determining thorium-232 concentrations to be used in making certification decisions. As stated in the draft final Sitewide Excavation Plan (April, 1998), the preferred thorium-232 analytical approach is gamma spectrometry, coupled with a standardization of the thorium-232 spectrometry methodology, using the EPA approved spectrometry approach.

(2) Develop and routinely use a FEMP reference standard to reduce analytical data variability. A large volume of FEMP soils was obtained, homogenized, and is being characterized and certified by DOE's Environmental Measurements Laboratory (DOE-EML) for use as a check standard. Once the DOE-EML's certification procedure is complete aliquots of the standard will be sent to commercial laboratories under contract by the FEMP for use as a check quality control standard to determine the acceptability of analytical certification data. The tight control limits developed for these DOE-EML "certified" soils will be required to be met by any commercial laboratory performing the certification analyses. The routine use of the check standard should help to reduce analytical variability.

(3) The alpha spectrometry data will be utilized for certification determination in the A1PI Certification Report as previously submitted, and the corresponding gamma spectrometry results will be included in Appendix B for reference. The commitment for the white paper report regarding the alpha/gamma spectrometry issue will be removed from the A1PI Certification Report.

Commenting Organization: U.S. EPA | Commentor: Saric
Section #: 5 | Page #: NA | Line #: NA
Original General Comment #: 2

Comment: The report provides certification data for 78 separate CUs. The report should contain one figure showing all of Area 1 and the CU layout. Moreover, the report should contain figures showing CU configuration changes over the course of the Area 1 Phase 1 (A1PI) project and figures illustrating changes in CU data point locations.

Response:

Figures 2-2, 2-3, and 2-4 in the A1PI Certification Report present the locations and dimensions of the Radiological CUs, Metal (inorganic) CUs and PCB CUs respectively. Due to the discrepant dimensions of the CUs for the three ASCOC suites in A1PI, overlaying all of the CUs on a single map is confusing and results in a figure that is not useful.

Changes within CUs were made for reasons specified in Table 2-4 in the A1PI Certification Report. The configuration of these CUs were changed "from" the original CU maps that appeared in the A1PI Workplan Certification Sampling PSP submitted in December 1996. In this original A1PI CU map the CUs were assigned as rectangular "blocks" based on spatial analysis of the existing data and production knowledge only. This initial configuration did not consider engineering limits, stockpiles, and other physical restrictions that were incorporated by necessity later. The "before" maps of the analytical suite CU boundaries are presented in a map included in the A1PI Certification PSP. Figures that show interim CU and data point location changes do not exist. The maps of final CU dimensions and configurations (i.e., Figures 2-2, 2-3, and 2-4) are presented in the A1PI Certification Report. The final locations for each CU are shown in the CU maps included in Appendix A. The changes made to the CU design are detailed in Table 2-4 in the A1PI Certification Report.

Action:

Original maps of all four suites of CUs, including primary radiological, secondary radiological, inorganic (metals), and PCBs from the A1PI Workplan Certification Sampling PSP, will be included in the revised report (Figures 2-5, 2-6, 2-7 and 2-8). Comparison can then be made to the current A1PI CU maps included in the A1PI Certification Report. The descriptions of changes made and the reasons for those changes included in Table 2-4 will be revised with any additional available information. Additional explanatory text has been included in Section 2.3.

The figure included as Attachment A has been developed to depict the current certified and characterized for reuse areas. This figure also includes the current remediation Areas 1 through 10. This figure is controlled by the Soil Characterization and Excavation Project (SCEP) and will be updated regularly. Additionally, a current revision of this figure will be included in each certification design letter that is submitted to the regulatory agencies for review and approval.

Commenting Organization: U.S. EPA | Commentor: Saric
Section #: Appendix A | Page #: All | Line #: Total Uranium
Original General Comment #: 3
Comment: The total uranium data provided in the tables have been rounded to tenths for all data sets in Appendix A. For example, the summary table for CU P17-22 states that the concentration of total uranium detected in sample P17-22C2-R-1-D is 5.8 micrograms per gram (μg/g). This value was rounded up; the actual value is 5.75 μg/g. The data provided in the tables for the other primary area-specific constituents of concern (ASCOC) have not been rounded. The data sets should be consistently presented. Therefore, the data tables should be revised to include all un-rounded values.

Response:
Uranium values were rounded because many of the total uranium values in the SED are calculated from isotopic values and have excessive decimal places. Numbers in the presentation tables were presented only for demonstration purposes and were rounded to comply with the significant figures needed for comparison to the FRL. The values were carried to at least one significant figure beyond the FRL requirements. In the statistics spreadsheet, the full values are retained and calculations were performed with those values. DOE feels the manner in which the data are presented in the A1PI Certification Report is sufficient for the intended purposes. There was no intent for utilization of the data contained in these tables to duplicate the statistical calculations.

Action:
Appendix A and Appendix B have been revised; the data are presented consistently.

Commenting Organization: U.S. EPA | Commentor: Saric
Section #: Appendix A-C | Page #: All | Line #: All
Original General Comment #: 4
Comment: The tables appear to have numerous errors, including missing data, incorrect values (0.01 to 0.3 concentration variations from the correct values), and unsupported data. The missing data include a value for total uranium in sample O20HS-1-R-13 (see Original Specific Comment 20). Incorrect data entries were noted in Appendix A in the data tables for the primary ASCOCs (see Original Specific Comment 21). The unsupported data include the data summaries for cesium-137 and thorium-230 (see Original Specific Comment 18). The data tables should be checked and revised to report all data accurately.

Response:
Comment acknowledged. For radiological parameters, analytical results are usually entered to three decimal places (0.000); the displayed result in Appendices A and B is to two places (0.00). In instances where the third decimal is a 5, Appendix A truncated the number and Appendix B rounded the number, which explains many of the noted discrepancies in the Appendices. For statistical calculations, the entire number was used so statistics are unaffected.

Action:

Tables found to be in error were corrected and reprinted, including the O20 hot spot data. Data that were missing from tables, including data representing the secondary radiological ASCOCs cesium-137 and thorium-230, were added to Appendix B.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix F Page #: All Line #: NA
Original General Comment #: 5
Comment: Appendix F contains on-site disposal cell sediment basin certification results. However, no data summary tables, figures, or other supporting documentation is provided for these results. Supporting documentation such as data summary tables or figures should be provided.

Response:

Agreed. The five OSDF sediment basin CUs were subjected to characterization for reuse to establish the ability to reuse soil excavated below a certified depth during construction for "clean fill." These soils were used as the primary source of the clay materials used to line basins in A2PI. Final remediation and certification of this sediment basin will take place after the basin is no longer needed to support OSDF construction.

Action:

In the revised A1PI Certification Report, Appendix F will be deleted; however, tables and figures will be developed presenting the certification analytical results from the OSDF Sediment Basins in the same manner as the other A1PI CUs.

SPECIFIC COMMENTS

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 3 Page #: Table 3-1 Line #: NA
Original Specific Comment #: 1
Comment: The text states that "the volumes for the A1PI sediment traps do not include soil in the berms." It is important to document the source of the soil used to construct the berms in order to reduce the potential for recontamination of the area. A figure should be provided to show the locations of the berms, and the text should be revised to identify the source of the soil used to construct the berms.

Response:

There are three sediment traps located within A1PI. They are referred to as A1PIST-1, A1PIST-2, and A1PIST-3. The material that was used to construct the berms for all three originated from the excavation of the sediment traps prior to remedial excavation and certification. Sediment trap CU A1P1ST-1 was certified in-place to reduce impact on the OSDF construction schedule. The berm materials in A1PIST-1 were considered impacted. Certification sampling and analysis testing was conducted on the native soils beneath the berm materials for all ASCOCs. The results passed certification analysis and the analytical results are

included in the A1PI Certification Report. A1PIST-1 was excavated during construction of OSDF Cell 1. The berm materials were placed in the East Impacted Material Stockpile.

As part of the Area 1 Phase II work scope, the remaining two sediment trap CUs, A1PIST-2 and A1PIST-3 (including the berm materials), will be sampled for certification. Following certification, the sediment traps will be graded for wetland mitigation.

Action:

A description of the origins of the berm material will be incorporated into Section 3.5. Figure 3-4, showing exact locations of the remaining sediment trap berms, will be provided. Prior to certification sampling and analysis, a certification design letter (CDL) for A1P1ST-2 and A1P1ST-3 will be submitted to the regulatory agencies for review and approval. A separate design package for the grading and restoration of these two sediment traps will be issued to the regulatory agencies for review and approval as part of the wetland mitigation effort.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 4.1.2 Page #: 4-3 Line #: 14
Original Specific Comment #: 2
Comment: The text indicates that the results for thorium-232 analyses of the certification samples by gamma spectrometry generally exceed the alpha spectrometry results for the same radionuclide in the same samples. This difference in analytical results can affect the decision as to whether certain CUs exceed the FRL for thorium-232. The proposed use of soil-specific radiological standards as calibration standards or check standards will be useful in addressing this problem. However, one useful principle is not discussed in the text, namely not making unnecessary assumptions. In this context, the analytical method involving fewer calculations and underlying assumptions with regard to the raw counting data and the final (reported) activity result would be the better method unless compelling reasons exist to accept the additional complications of the alternate method. This principle should be considered in resolving the methodological discrepancy.

Response:

Please see response to Original General Comment #1.

Action:

Please see action to Original General Comment #1.

Commenting Organization: U.S. EPA | Commentor: Saric
Section #: 5.3.4 | Page #: 5-4 | Line #: 33
Original Specific Comment #: 3

Comment: The text states that "the 0-6 inch interval across the entire P17-32 CU was excavated." However, Figure 5-8 does not support this statement. According to the pre-excavation and post -excavation elevations presented in the figure, several data points indicate that less than 6 inches of soil was removed, which is not acceptable. The text should be revised to address this issue.

Response:

CU P17-32 failed after initial excavation for arsenic contamination on initial certification sampling and analysis. As a corrective action, "in situ" certification samples at several intervals were obtained with the Geoprobe at specified depths and analyzed for arsenic. The .5 to 1.0 feet increment was found to be below the arsenic FRL and the commitment was made to remove .5 feet (assuming top down contamination) to achieve certification with no further sampling. Figure 5-8 included in the document contained pre and post-excavation elevations that did not support the removal of .5 feet of soil at all locations in the CU, without further explanation.

Prior to corrective action excavation of .5 feet from CU P17-32, a pre-excavation survey was conducted at 30 survey control points. Unfortunately, the CU was regraded immediately after excavation of the .5 feet and prior to conducting the post-excavation control survey. Calculations of removed soil volume were conducted using the data presented in Figure 5-8. Differences between pre- and post-excavation survey elevations were summed and averaged. The average soil depth removed across the CU was calculated at .869 feet compared to the commitment of .5 feet. If .5 feet (6") was excavated from across the CU approximately 394 cubic yards of soil would be generated. Approximately 704 cubic yards were actually generated in the excavation process (based on the .869 feet average excavation depth). In summary, even after post excavation re-grading, 9 of the 30 locations that were used as survey control points showed less than .5 feet of excavation, 21 of the 30 exhibited greater or equal to .5 feet, and 15 of the 30 exhibited over 1.0 feet of excavation. Therefore, the commitment to remove 6" of soil across CU P17-32 was exceeded by approximately 70%.

Action:

Text will be added in Section 5.3.4 on page 5-5 to describe Figure 5-8 and the corrective action performed in CU P17-32 in more detail.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5.3.5 Page #: 5-5 Line #: 19
Original Specific Comment #: 4

Comment: The text discusses an original certification sample collected in CU O20 that exceeded the "2 x FRL" criterion for radium-228 (indicating a "hot spot"). This sample was collected from the northernmost border of the Fernald Environmental Management Project (FEMP). The extent of radium-228 contamination has not been defined to the north of this location. The text should be revised to present plans to properly delineate the extent of radium-228 contamination to the north of CU O20.

Response:

The basis of the comment is erroneous. There were two separate issues in CU O20. The first was a "hot spot" failure for total uranium. One of the certification samples (certification sample number 8 on the northwest boundary) came back at 205 ppm for total uranium. The FRL for total uranium is 82 ppm in this area, so this sample point was considered a "hot spot" by the criteria of 2xFRL. A corrective action plan was carried out, and this total uranium hot spot was successfully removed. Removal of the total uranium hot spot was bounded with a sample point to the north. Details of this removal and associated data are provided in the report in Section 5.3.5, Page 5-5.

An FRL failure for radium 228 was also noted in CU O20 based on the original certification data. There was no hot spot for radium 228 because no single sample exceeded 2xFRL of 1.8 pCi/g. The highest single value was 2.46 pCi/g. The CU failed the certification criteria for radium 228 due to the high data variability for this ASCOC. Seven additional random samples were obtained to supplement the existing 12 samples, and the UCL on the mean met the FRL when the additional sample data were integrated.

Additional samples will be collected north of CU O20 during the Area 9, Phase I off-property certification process.

Action:

The content of the above response will be incorporated into Section 5.3.5 of the revised A1PI Certification Report.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5.3.5 Page #: 5-5 Line #: 14
Original Specific Comment #: 5
Comment: The text describes the intervals used for collection of samples for radium-228 analyses. It is critical to precisely determine the depths of the contamination present in this CU in order to ensure that adequate corrective action has been taken. The soil placed in the sample jars should have been representative of the soil contamination at a particular depth. The sampling depth may have been interpreted imprecisely if total recovery did not occur during sampling. The text should be revised to provide recovery or other data supporting the sampling interval designations.

Response:
Comment Acknowledged. When collecting Geoprobe® cores, the cores are measured to determine the amount of the sample interval recovered. Generally, if a total recovery is not achieved, this fact is noted in the field log, and the operator will collect a parallel core so a total recovery is realized. Field logs for the Geoprobe® core samples obtained during the radium-228 corrective action in CU O-20 have been reviewed for entries indicating less than total recoveries. As a result of reviewing field logs generated during the corrective action in CU O20, there was no indication that Geoprobe® cores collected during this sampling event had less than complete recoveries.

Action:
No Action.

Section #: 5.3.5 Page #: 5-5 Line #: 30
Original Specific Comment #: 6
Comment: The text states that confirmatory samples were collected from the area of the CU O20 hot spot, and the total uranium analytical results are provided. It is important to determine whether the contamination in this area was adequately evaluated and delineated. Illustration of the total uranium results on a figure would assist in this determination. Therefore, the analytical results should be illustrated in Figure *TBD*.

Response:
Comment acknowledged.

Action:
Figure 5-13 shows the sample locations for the confirmation samples in the CU O20 area after excavation. Uranium sample results were added to Figure 5-13 and the revised figure is provided.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Tables 5-6 and 5-7 Line #: NA
Original Specific Comment #: 7
Comment: The tables provide post-corrective action radium-226 concentrations and their corresponding depth intervals for CUs Q18-40A and Q18-40B. Many of these concentrations increase with depth at the sampling locations. The data appear to indicate another source aside from air dispersion that contributed to the radium-226 contamination in this area. The text should be revised to address this issue.

Response:

Q18-40 failed on the first certification effort for radium-226 only. The elevated levels were confined to the southern half of this CU, so the CU was divided into Q18-40 A (north) and Q18-40 B (south). A corrective action plan was carried out and Q18-40B was excavated and recertified while Q18-40A was recertified with no excavation. Serial sequential sampling was conducted on Q18-40B and samples were analyzed to select the correct interval to certify. The following table summarizes the radium-226 data presented on Tables 5-6 and 5-7.

CU	Interval	Number of Samples	Mean Ra-226 Concentration
Q18-40A	0-6 inches	12	1.28 pCi/g
Q18-40A	6-12 inches	12	1.43 pCi/g
Q18-40B	6-12 inches	12	1.43 pCi/g
Q18-40B	12-18 inches	12	1.33 pCi/g

Review of the average concentrations does show a slight increase at depth for CU Q18-40A, but a decrease for CU Q18-40B. For the background data set, the 95th percentile for radium-226 is 1.42 pCi/g. The concentrations measured in these CUs are all within the background levels and the analytical uncertainties. Therefore these data do not bring into question that the radium-226 contamination came from another source than air deposition.

Action:

This explanation will be incorporated into Section 5.3.3 of the revision of the A1PI Certification Report.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Table 5-9 Line #: NA
Original Specific Comment #: 8
Comment: The text below the table states that the location where the original certification sample with a total uranium concentration of 205.4 milligrams per kilogram (mg/kg) was collected is identified as sample point 1. This designation does not correspond with the designation of the hot spot sampling location depicted in Figure 5-9. The text or figure should be revised to resolve this apparent discrepancy.

Response:
Figures 5-9 and 5-13 incorrectly demonstrate the hotspot sample location within CU O20.

Action:
Figure 5-9 and 5-13 will be corrected. Table 5-9 is correct and needs no revision.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Table 5-9 Line #: NA
Original Specific Comment #: 9
Comment: The table summarizes the depth increments analyzed for each of the sampling locations in CU O20. Apparently only a portion of the sampling locations were extended to include 18 inches of sampling interval. The text should be revised to provide the rationale for the sampling strategy used.

Response:
Comment Acknowledged. Additional description of the sampling strategy is required.

Action:
The following text will be added to Section 5.3.5, Page 5-5 of the A1PI Certification Report to summarize the sampling strategy.

..... The existing analytical and HPGe data obtained in CU O20 was kriged to illustrate the lateral and vertical extent of the total uranium contamination at the identified hot spot and immediate surroundings . Based on this kriging, sample points in O20 were selected to bound the surface and subsurface extent of total uranium in the area of potential influence around the hot spot. The model indicated a surface contamination condition (i.e., a greater area of probable total uranium contamination present in the surface soil layer). Several strategic sample points close to the hot spot were chosen to gain adequate surface and subsurface delineation data to design the corrective action excavation. Additional sample points were selected away from the hot spot to collect surface data to further bound the extent of surface contamination. The combined data points are shown in Figure 5-9.....

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Table 5-10 Line #: NA
Original Specific Comment #: 10
Comment: The text provides sample numbers designated as "original" 1 through 12 and "new" 1 through 7. This sample numbering scheme is confusing and may cause improper data interpretation. The sample numbers should be revised to 1 through 19. This sample numbering scheme should also be used in Figure 5-14.

Response:
Comment acknowledged.

Action:
The sample location numbers in Table 5-10 and Figure 5-14 will be changed to match those listed in Appendix A, CU O20 Radium-228 Map of Data Points.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Table 5-11 Line #: NA
Original Specific Comment #: 11
Comment: The table states that sample NAR-4-8C-(X) corresponds with the 15- to 21-inch sampling interval and that sample NAR-4-8C2-(X) corresponds with the 38- to 42-inch sampling interval. In Figure 5-15, however, the opposite is shown. Either the table or figure should be revised for accuracy.

Response:
Comment acknowledged. Table 5-11 is incorrect and will be changed to reflect the correct depth for the two samples. Figure 5-15 is correct as it appears in the document.

Action:
Table 5-11 will be corrected.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Table 5-11 Line #: NA
Original Specific Comment #: 12
Comment: The table does not include a line for sample NAR-4-15C-(X) and its corresponding depth interval. The table should be revised to include this information.

Response:
Comment acknowledged.

Action:
The depth interval for sample NAR-15C-(X) is 70 - 74 inches. This information will be added to Table 5-11.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Figure 5-7 Line #: NA
Original Specific Comment #: 13
Comment: This figure identifies the random sampling points in CU P17-32. However, sampling location 17 is not shown in the figure. The figure should be revised to include sampling location 17.

Response:
Table 5-8 is incorrect, 17 samples but only 16 locations exist, one location was sampled twice (one for duplicate). Figure 5-7 needs no revision.

Action:
Table 5-8 will be revised to remove Location #17.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Figure 5-8 Line #: NA
Original Specific Comment #: 14
Comment: The figure provides the pre-excavation and post-excavation elevations for CU P17-32. However, the elevation information shown for the central, eastern border of the CU does not include a post-excavation elevation. The figure should be revised to include the post-excavation elevation for this location.

Response:
Comment acknowledged. The referenced elevation value on the eastern boundary of CU P17-32 was on the very edge of the 6" excavation and was not excavated itself. For this reason, the point retains the same value for both pre-excavation and post-excavation.

Action:
No Action.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: 5 Page #: Figure 5-9 Line #: NA
Original Specific Comment #: 15
Comment: The figure shows the sampling locations in CU O20 selected to support hot spot removal. However, the figure does not include sampling location 2. The figure should be revised to show this sampling location. In addition, the figure should include a reference to the original hot spot sample number.

Response:
Comment acknowledged.

Action:
Figure 5-9 will be corrected with sample location #2 labeled and the hot spot sample location properly referenced as sample location #1.

Commenting Organization: U.S. EPA Commentor: Saric
Section #:5 Page #: Figures 5-10, 5-11, 5-12, and 5-13 Line #: NA
Original Specific Comment #: 16
Comment: The figures provide the total uranium concentrations for separate sampling depth intervals and the hot spot excavation depths for CU O20. The figures are currently somewhat unclear. To clarify the figures, they should be revised to show all the sampling locations and their corresponding numbers.

Response:
Comment acknowledged.

Action:
Figures 5-10 through 5-13 will be revised to show all of the sample locations and sample numbers.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: Data Tables Line #: NA
Original Specific Comment #: 17
Comment: The data tables in Appendix A present the concentrations of contaminants of concern detected at the site. However, no units of measure are listed in the tables. The tables should be revised to include the units of measure for each of the concentrations listed.

Response:
Comment acknowledged.

Action:
The tables were revised to include units.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: Data Tables Line #: NA
Original Specific Comment #: 18
Comment: The data tables in Appendix A include data summaries for samples analyzed for cesium-137 and thorium-230. Appendixes B and C do not provide such summaries for CU N19. The document should include supporting data for all the tables in Appendix A.

Response:
Comment acknowledged.

Action:
Appendices were reviewed and missing data are included in revised tables in Appendix A.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: 020 Primary Rad Map Line#: NA
Original Specific Comment #: 19
Comment: The figure labels the new and original data points sequentially from 1 through 19. These labels do not correlate with Figure 5-14, where the data points are labeled as original sampling points 1 through 12 and new sampling points 1 through 7. The figures should label the data points identically.

Response:
Comment acknowledged.

Action:
The sample location numbers in Table 5-10 and Figure 5-14 will be revised to match those listed in Appendix A, CU O20 Radium-228 Map of Data Points.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #:Data Table CUO20 Line #: NA
Original Specific Comment #: 20
Comment: The data table for CU O20 summarizes the total uranium data. This table omits a value for total uranium in sample O20HS-1-R-13. The table should be revised to include this information.

Response:
Comment is not clear as written.

Action:
The Total Uranium result for sample O20-HS-1-R-13 in the Appendix A data table is listed as 12.81. The formatting of this table may be confusing and will be revised.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: Data Tables Line #: NA
Original Specific Comment #: 21
Comment: These data tables are not entirely consistent with the data summaries in Appendix B. For example, the table for CU P17-22 indicates that radium-226 was measured at 2.66 picocuries per gram (pCi/g) and radium-228 was measured at 2.61 pCi/g in sample P17-22C2-R-2. However, the data summaries indicate that the concentrations of radium-226 and radium-228 in sample P17-22C2-R-2 were 1.33 and 1.31 pCi/g, respectively. The data tables in Appendix A and data summaries in Appendix B should be compared, and all such inconsistencies should be resolved.

Response:
Comment acknowledged.

Action:
For the example given, a re-analysis was performed on the sample. The "old" value was not given a " Z" qualifier which would automatically discount it from being considered. Because of this, the two values were inadvertently added together when the new value was pulled up. The statistics were generated using the correct numbers, so no error was carried over into the statistical evaluation. The data tables of Appendix A and Appendix B were carefully reviewed for other errors. Errors were corrected and the affected tables reprinted. The data table for CU P17-22 will also be corrected and reprinted.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: Q19-30 Primary Rad Map Line #:NA
Original Specific Comment #: 22
Comment: Sampling location 5 is not depicted in the figure. The figure should be revised to show this data point.

Response:
Comment acknowledged.
Action:
The CU Q19-30 Primary Rad Map was corrected and reprinted with sampling location #5 indicated.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: A1P1ST-1 Metals Map Line #: NA
Original Specific Comment #: 23
Comment: The figure contains an unlabeled data point. The figure should be revised to label this data point.

Response:
Comment acknowledged. The unlabeled data point in the A1PIST-1 Metals Map does not represent a sampling location.

Action:
This figure was corrected and reprinted with the unlabeled data point excluded.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: NEAR-1 Metals Map Line #: NA
Original Specific Comment #: 24
Comment: The figure contains a data point with two location numbers, 14 and 16. The figure should be revised to display only the single, discrete label for this point.

Response:
Comment acknowledged. The data point labeled 14 and 16 in the NAR-1 Metals Map actually refers to sampling location 14.

Action:
This figure was revised and reprinted with the data point correctly numbered.

Commenting Organization: U.S. EPA Commentor: Saric
Section #: Appendix A Page #: NEAR-1 PCBs Map Line #: NA
Original Specific Comment #: 25
Comment: The figure contains a data point with two location numbers, 14 and 16. The figure should be revised to display only the single, discrete label for this point.

Response:
Comment acknowledged. The data point labeled 14 and 16 in the NAR-1 PCB Map actually refers to sampling location 14.

Action:
The figure was corrected and map reprinted with this data point correctly numbered.

RESPONSES TO OHIO EPA COMMENTS ON THE AREA 1 PHASE I CERTIFICATION REPORT

Commenting Organization: OEPA
Commentor:
Section #: Not Applicable (NA) Page #: NA Line #: NA
Original Comment #: 1

Comment: The Ohio EPA will not concur that an area is certified prior to the work actually being completed. Specifically, excavations in the areas of the North Access Road and the adjacent ditches are deferred to the future. The Ohio EPA does not intend to certify areas as remediated until all activities have been completed.

Response:

Comment acknowledged. DOE agrees that CUs NAR 1-6 can not be considered certified until the specified road material, fill material, and uncertified soil have been excavated and disposed of appropriately. The six CUs comprising the Old North Access Road (NAR) and ditches in A1PI (certification units NAR 1-6) were certified "in place" by taking waste acceptance criteria (WAC) and certification samples at depth and analyzing them as per previous agreement reached with the Regulatory Agencies. No WAC or certification sample result obtained when sampling these certification units (CUs) was at or above the FRLs for ASCOCs. To remove artificial or imported media that can not be certified, a level of excavation into native material residing beneath the road fill is specified. When this road and fill material in CUs NAR 1-6 is excavated to the specified depth, certification of these CUs will be considered complete. However, due to construction demands, completing excavation of the NAR CUs will be a phased process dictated by the OSDF construction schedule.

A northern section of approximately 350 feet of the NAR between the intersection of the new NAR and the northern perimeter of the OSDF has been left intact to provide support for OSDF construction. This unexcavated northern section of roadway must be kept intact until OSDF construction is completed. Beginning at coordinate N 483445, E 1351342 approximately 1,300 feet of the NAR within the OSDF footprint (cells 1, 2 and half of cell 3) has been excavated to or beyond the specified certification depth. This excavated zone currently terminates at coordinates N 482175, E 1350928 which is approximately 250 feet north of the southern extreme of the A1PI NAR CUs. The southern (250') and northern (350') sections of the old NAR will not be considered certified until the artificial or imported materials have been excavated.

The remaining southern 250 foot section of certified in place old NAR will be excavated during July 1998 to accommodate the construction of the OSDF Cell 2 compacted clay liner. A separate certification letter report for the southern section of the road will be submitted to the regulatory agencies after excavation to certification depth. The northern section of the old NAR will be transferred to Area 10, Corridors. Both the southern and northern sections will no longer be considered a portion of Area 1, Phase I and consequently will not be included in the Area 1, Phase I Certification Report.

The roadway south of A1PI has not been subjected to certification and WAC attainment sampling and will be addressed in the workscope detailed in the Certification Design Letter (CDL) for Area 1 Phase II, Sector 2. After in place certification and WAC attainment are

completed, the remaining sections of the old NAR will be excavated sequentially to accommodate the construction of OSDF Cells 4, 5, 6, 7, and 8.

Action:

The A1PI Certification Report figures will be revised to depict the status of the remaining sections of the certified in place old NAR. Also, Figures 3-5 and 3-6 illustrate the depth of excavation that has been achieved in the excavated portions of the NAR. The report will also include a schedule for the removal of the southern 250 foot section of the A1PI NAR CUs. The southern and northern sections of the A1PI NAR CUs will be removed from the A1PI Certification Report. These sections will be certified when excavated to the specified depth of certification sampling. A separate certification letter report for the southern section will be submitted to the regulatory agencies. The northern section will be addressed in Area 10, Corridors. Text has been included in Section 3.6 of the revised A1PI Certification Report to explain this action.

Commenting Organization: OEPA Commentor:
Section #: 1 Page #: 1-2 Line #: 9
Original Comment #: 2

Comment: Figure 1-2 is not sufficiently illustrative to delineate areas that have been excavated from areas that have not been excavated. Figure 1-2 appears to have been lifted straight out of the OU5 RI/ FS. Replace this figure with a figure showing the CUs, the areas excavated, and the areas where excavation was not performed.

Response:

Comment acknowledged. OEPA is correct in their observation that Figure 1-2 in the A1PI Certification Report is based on an overlay of the proposed soil excavation footprint using RI/FS data. This figure has a misleading title and instead of "A1PI Excavation Footprint" should be titled "Preliminary Sitewide Soil Excavation Footprint Based On RI/FS Characterization Data." Figure 3-1, titled "Excavation Limits of A1PI," shows the actual boundaries that were excavated as a result of A1PI remediation.

Action:

The title of Figure 1-2 will be corrected in the revised report to "Preliminary Sitewide Soil Excavation Footprint Based On RI/FS Characterization Data."

Commenting Organization: OEPA Commentor:
Section #: 1 Page #: Figure 1-1 Line #: NA
Original Comment #: 3

Comment: This figure (Figure 1-1) should be revised to show the new Remediation Area 8 west of Paddy's Run Creek.

Response:

Agreed. Figure 1-1, titled "General Remediation Areas 1 through 7," was accurate at the time this document was prepared. Subsequently, General Remediation Areas 8, 9, and 10 have been

added to account for the area between Paddy's Run and the west boundary of the site, the off-property area adjacent to the east boundary of the site, and the areas of the site that contain the Advanced Wastewater Treatment Facility and Long-Term Corridors, respectively.

Action:

General Remediation Areas 8, 9, and 10 will be added to Figure 1-1.

Commenting Organization: OEPA Commentor:
Section #: 2 Page #: 2-9 Line #: 14
Original Comment #: 4

Comment: We agree that it is preferable to sample for primary and secondary COCs from the same locations. We expect in the future, the CUs for both primary and secondary CUs *COCs* will be collocated.

Response:

Agreed. Simplification of the certification process is beneficial to all parties. CUs and sampling points for primary and secondary COCs will be collocated in future whenever possible.

Action:

Future certification strategy reflects this understanding, and is discussed in the revised Sitewide Excavation Plan (SEP).

Commenting Organization: OEPA Commentor:
Section #: 2 Page #: 2-9 Line #: 18
Original Comment #: 5

Comment: The discussion on "weighting factors" is unclear. However, we do agree that the statistical approach used is appropriate and that the use of weighting factors should be avoided.

Response:

Comment acknowledged. The referenced discussion attempted to explain the certification sampling approach used in A1PI. In order to simplify the method of statistically processing certification results, each sample result obtained from a CU would be given equal merit or "weight." This would prevent an additional assumption (regarding what proportion of a CU one sample represents) being required in the statistical calculations. In order to achieve this in a consistent manner, each CU is always divided into 16 subunits. If the geometry of a CU isn't a square or rectangle, in an unbiased manner it is divided into sixteen subunits that are as equal in area as possible. A sample obtained at random from within each one of these subunits will then be considered equal to the other samples obtained from that CU. Using this process no additional "weighting factor" is necessary.

Action:

The discussion on the "weighting factor" concept will be deleted from the text.

Commenting Organization: OEPA
Section #: 3.4 Page #: 3-2
Original Comment #: 6

Commentor:
Line #: NA

Comment:

The discussion in this section is appropriate and helpful. Please include a similar discussion with future certification reports. Ohio EPA has previously asked for additional information on the areal extent of soil excavations. We would like to see a calculation that compares the volume of soil actually in the piles to the volume of soil calculated using the number of acres excavated in a nominal 6 inch lift. (Of course a "fluff" factor will be required to compare the bank volume with the pile volume.) For example the Executive Summary states that 59 acres were excavated.

(59 acres x 43,560 ^{ft}/acre x 0.5 ft. depth)/27 ft^3/yd^3) = 47,600 yd^3 excavated
47,600 yd^3 x 10% fluff factor = 50,000 yd^3 more or less

This is somewhat more than the 37,400 yd^3 quoted in Table 3-1. Since the debris piles total less than 1000 yd^3, their additional volumes do not help very much to reconcile the difference.

Response:

Of the 53 acres comprising A1PI (East), 46 acres (minus the A1PI sediment traps and berm materials) were excavated and placed in the East Impacted Soil Stockpile (EISSP). In Table 3-1 of the A1PI Certification Report, it was stated that the EISSP contains 30,300 yd^3 of soil resulting from the excavation of a 6-inch lift from the surface of 46 acres subjected to remediation east of the NAR. A 6-inch lift of surface soil over an acre generates approximately 807 yd^3 of soil (0.5 ft deep x 43,560 ft^2/27 ft^3 per yd^3 = approx. 807 yd^3) of bank volume (no fluff factor applied). Survey measurements used for this volume calculation were made prior to the completion of placement activities on the east stockpile from excavations performed in A1PI. More current independent survey measurements obtained by B.L. Payne and Associates indicated that there is approximately 34,700 yd^3 of soil in the EISSP.

Of the 46 acres on the east side of the NAR that contributed soil to the EISSP, deductions must be made for subareas within the 46 acres but did not contribute soil volume to the stockpile. Subareas that must be subtracted from the 46 acres prior to determining volume estimates are the A1PI sediment traps A1PIST-1, A1PIST-2, and A1PIST-3. The sediment traps remain in place along with their excavated berm material. The estimated area of the combined A1PI sediment traps is 1.8 acres. This total subtracted from 46 acres is 44.2 acres of effective area that was excavated and contributed to the EISSP. 44.2 acres x 807 yd^3/acre = approx. 35,700 yd^3. This volume estimate is within 1,000 yd^3 of the recently calculated volume of 34,700 yd^3. This is within a 10% margin of error even considering the 1,300 yd^3 contributed by CU Q18-40B. The fluff factor of expansion of bank volume into stockpile volume is not known but would be minimal due to the effective compaction of soil during placement by heavy equipment.

Action:

Revised volume estimates of the stockpiled material, including the EISSP and sources, will be added to Table 3-1 and in Section 3.2.

Commenting Organization: OEPA Commentor:
Section #: 4.1.2 Page #: 4-2 Line #: NA
Original Comment #: 7

Comment: There are several unresolved issues relating to the analytical procedures for radioactive COCs.

1. The Ohio EPA has not received the letter report (page 4-3 line 6) detailing the discrepancies between alpha spectroscopy and gamma spectroscopy methods for analysis of thorium-232.

2. This is the first mention that we recall of a site-specific Th-232 standard for soils. We have discussed a soil standard for technetium-99 and we are optimistic that this standard will be valuable in assessing the significance of any analytical discrepancies between split soil samples.

3. The document does not provide a mechanism to effect closure on any of these issues or a way to track progress. Please suggest a way to keep the regulators appraised of the evolving status of these procedures.

Response:

1) Please see response to USEPA Original General Comment #1.

2) The technetium-99 soil standards of 5 pCi/g and 30 pCi/g, representing the minimum detection limit (MDL) and FRL/WAC respectively, were made up in order to increase the level of confidence in analytical methods used for analyzing soil samples for this constituent. Using similar logic, bulk soil was obtained from an on-site area (Southern Waste Units) known to have slightly elevated levels of radiological constituents including thorium-232. The goal was to completely homogenize this material for use as an analytical standard or control. This is being completed so that DOE can utilize a standard that contains thorium 232 "in the range" of the site FRL.

3. Analytical issues such as these should be discussed in the DOE/Agency weekly conference calls or monthly meetings, as they arise, to discuss progress on the analytical issues such as technetium-99, and other pertinent analytical or laboratory issues.

Action:

1) Please see action to USEPA Original General Comment #1.

2) Details of the thorium-232 analytical soil standard development program will be provided to the regulators.

3) Discuss pertinent analytical and laboratory issues as necessary during the weekly DOE/Agency conference calls or monthly meetings.

Commenting Organization: OEPA Commentor:
Section #: 4.3 Page #: 4-7 Line #: NA
Original Comment #: 8

Comment: The Ohio EPA considers that duplicate samples are most useful as a check of sampling and lab errors. We believe that it is more appropriate to report the original sample concentration than it is to average the original and the duplicate.

Response:

Comment acknowledged. The standard procedure has been to average field duplicate sample results (as opposed to laboratory duplicates) with the result from the original sample result. A field duplicate originating from a sample point is by definition of equal validity to the original sample. A duplicate sample is normally co-located and not "split," and therefore can have a different concentration of constituent(s) if the region is non-homogeneous. Selecting the original sample result or the duplicate result as "more valid" is arbitrary. The goal of characterization sampling is to obtain a representative concentration of that sample point, and this is best done by averaging the original and duplicate sample results.

Action:

No Action.

Commenting Organization: OEPA Commentor:
Section #: Appendix E Page #: E-72 Line #: NA
Original Comment #: 9

Comment: The original comment suggested the use of a riffle splitter and the response adequately addressed our concerns. However, the response also brings to mind outstanding issues with potential volatilization of technetium during the drying step. These potential problems first came to light during the split sampling performed for WAC attainment in Area 2 Phase I. Concerns such as these will be better addressed during the regulators review of the Site Wide CERCLA Quality Assurance Plan (SCQ).

Response:

Comment acknowledged. In order to resolve this comment, DOE passed the question on to our laboratory subject matter experts, who consulted with nationally recognized authorities on the technetium-99 volatility issue. Their report concluded without reservation that technetium-99 will not volatilize to any significant degree as a result of preparation and drying methods used by the DOE on-site laboratory or off-site contract laboratories.

Action:

A copy of the referenced technetium volatility report will be included with the revised document.

Extension:	648-5447	**Subject:**	**POTENTIAL LOSSES OF Tc-99 DURING SOIL SAMPLE PREPARATION AND ANALYSIS**

c: File Record Storage Copy 106.4.34.4
Al Bacon, MS52-8
J.D. Chiou, MS52-5
Alex Duarte, MS35
Tony Klimek, MS52-5
Joan White, MS52-5
Mark Cherry, MS52-5
Tom Crawford, MS50
Eva Dupuis-Nouille, MS52-0
Chris Sutton, MS35
Vicky Zimmerman, MS52-5

For the reasons stated below, it is the professional judgement of the FDF Radiochemistry Lab that the drying, grinding and blending of soil samples submitted for Technetium-99 (Tc-99) analysis will not cause significant losses from volatilization of the technetium analyte. Because of questions that have been raised by people associated with the Soil Characterization and Excavation Project and by regulators, I am writing this memo to provide the basis for this judgement.

SAMPLE PREPARATION AND ANALYSIS

The Tc-99 analysis procedure used in the Fluor Daniel Fernald (FDF) Radiochemistry Lab is patterned after methods used at three Department of Energy (DOE) facilities: the DOE Environmental Measurements Laboratory (EML), the Oak Ridge National Laboratory (ORNL), and the Portsmouth Gaseous Diffusion Plant (PGDP). The FDF procedure is similar in approach and technique to the procedures used at these DOE facilities especially in regard to sample pretreatment (drying, grinding and blending) and separation chemistry. The pretreatment consists of drying the soil samples overnight in a convection oven at 110° Celsius and then grinding and blending the samples to homogenize them. The Tc-99 chemical separation begins with leaching the samples with dilute nitric acid in the presence of potassium

INTEROFFICE MEMORANDUM

persulfate, an oxidizer. After clarifying the leachate by centrifuging, an iron carrier is added and bulk amounts of metals including uranium, thorium and their decay products are removed by precipitation with ammonium hydroxide and centrifugation. The acidified sample extracts are passed through an anion exchange column, which retains technetium as well as other interfering ions. The interferents are washed from the anion exchange resin with 1 molar nitric acid, and then technetium is removed from the columns by rinsing with 12 molar nitric acid. The purified technetium eluate is evaporated onto stainless steel planchets and counted on a low background gas flow proportional counter. Sample temperatures remain below 200°C throughout the preparation and purification process. Two aliquots of each sample are processed - one spiked with an accurately known amount of Tc-99 and one with no spike. In this manner, a technetium chemical recovery is measured for each individual sample.

Tc SPECIES IN THE ENVIRONMENT

Several different chemical species of technetium may be found in the environment, primarily halide compounds and oxides. The particular species found in the environment depends on the type of operations conducted in the facility from which the technetium was released. Halide compounds of technetium are less stable and tend to undergo reactions that gradually convert them to the more stable oxide forms, primarily TcO_2 and TcO_4^-. It is expected that due to the nature of the operations at Fernald, technetium will be either TcO_2 or TcO_4^-. Of these forms, the pertechnatate ion, TcO_4^-, is more stable.

POSSIBLE VOLATILIZATION OF Tc DURING ANALYSIS

For the reasons listed below, the FDF radiochemistry staff does NOT believe that technetium volatilization is a significant loss mechanism during sample preparation and analysis.

1. The FDF Tc-99 analysis procedure is similar to that used by the DOE Environmental Measurements Lab, the Portsmouth Gaseous Diffusion Plant and also to the one described in technical report ORNL/TM-7386, Sampling of Technetium-99 in Vegetation and Soils in the Vicinity of Operating Gaseous Diffusion Facilities, published in October, 1980. The soil drying and grinding operation in the FDF Analytical Lab is the same as that in the two procedures referenced above. Both PGDP and ORNL then take the additional step of igniting their soil samples in a muffle furnace at temperatures in excess of 500°C to destroy organic material and ash the samples. The ORNL report states that losses of technetium due to volatilization were less than 3% as a result of

FLUOR DANIEL FERNALD

INTEROFFICE MEMORANDUM

the muffling operation. This is significant because the technetium species in the environs of gaseous diffusion plants are likely to be the more volatile halide compounds. Over the years, neither organization has noted serious losses of technetium due to volatilization under these more harsh conditions. Certainly the effect of merely drying samples at 110°C would be negligible.

2. The FDF method validation report shows the FDF Tc-99 analysis method was unbiased and yielded an average Tc-99 percent recovery in soil of 96.2% $\pm$ 8.9% at the ninety five percent confidence level. There is no evidence from the validation studies that volatilization of Tc-99 was a significant loss mechanism. In addition, laboratory control samples (LCS) with a known Tc-99 concentration are processed by FDF with each batch of environmental samples. These LCS samples show no evidence of consistently low analyte recovery as one would expect if Tc-99 volatilization was occurring.

3. Based on experience gained from previous unrelated medical research with Tc-99, one of the FDF radiochemists saw no evidence of technetium volatilization from a variety of technetium compounds including the pertechnatate ion at temperatures up to 300°C. Although some of the compounds were different, this experience indicates that volatilization should not be an important consideration for the drying and grinding process used to pretreat samples undergoing Tc-99 analyses because the temperatures are kept well below the point where volatilization losses become significant.

This memorandum describes studies conducted by the FDF Radiochemistry Lab to assess the potential losses of ^{99}Tc due to volatilization of this analyte during the sample preparation process. This memo should be considered as an addendum to the original ^{99}Tc Method Validation Report, Radiochemical Determination of Technetium-99 in Various Matrices, issued June 9, 1997.

On 9/26/97 three 20 gram aliquots of soil already present in the lab and used in the past as a blank were weighed into three evaporating dishes. 1 ml of RAG #741, ^{95m}Tc standard prepared on 9/26/97, was pipetted into each dish, then approximately 25 ml of distilled water were added to slurry the soil and ensure even mixing of the ^{95m}Tc throughout the soil. The soil slurries were allowed to dry at room temperature uncovered in a fume hood over a period of three days (9/26 thru 9/29).

On 9/29/97 the soils had dried out into a solid mass. The resulting dry mass was broken up and mixed in each evaporating dish with a glass stirring rod. The dishes were covered with a glass beaker cover and counted on the lab's HPGe detectors for 15 minutes each. This time was sufficient to give at least 1000 counts in each of three characteristic ^{95m}Tc gamma peaks (204, 582, and 835 keV). A blank 20 gram aliquot of the same soil without ^{95m}Tc added was also counted on both detectors used.

After counting, the soils were uncovered and heated overnight in a drying oven. The drying time was from 1250 on 9/29 to 0524 on 9/30; total elapsed time was 17 hours, 14 minutes. The temperature was verified at both the beginning and end of the drying time as

FLUOR DANIEL FERNALD

INTEROFFICE MEMORANDUM

107°C. The soils were removed from the oven, cooled to room temperature in a desiccator, and recounted on the same detectors used to count the same samples on 9/29.

The counting results are presented here:

Technetium Volatilization Study

	count time	15 min		decay correction	1.0114	^{95m}Tc half life	61 days
	Sample	Count date 9/29/97			Count date 9/30/97*

4	B	7035	1994	1352	7294	1919	1291
3	C	7525	2072	1411	7616	2070	1405
3	blank	0	96	0			
4	blank	0	74	0			
3	blank	0	96	0			
	net cpm A	546.3	141.5	100.7	532.4	132.5	97.4
	net cpm B	469.0	128.0	90.1	491.8	124.4	87.1
	net cpm C	501.7	131.7	94.1	513.5	133.1	94.7
	% change	-2.55	-6.38	-3.28	avg	-4.07	
	% change	+4.87	-2.81	-3.42	avg	-0.45	
	% change	+2.37	+1.04	+0.71	avg	+1.37	
					grand average	***-1.05***	

- The net count rates calculated for the 9/30 counts have been decay-corrected to 9/29 to compare equivalent quantities.

As can be seen at the bottom of the chart, the net average change after drying is calculated as -1.05%. This value is within the limits of experimental error, and supports the Radiochemistry Group's contention that Tc is not volatile at the temperatures used to dry samples in SPL.
