SUBJECT: **Contract No. DE-AC24-03OH20152: Deliverable #36 Building Data Package; Section C.2.1.2 Facility Transfer; T Building Data Quality Report, Final**

Dear Mr. Pfister:

Attached is the following Final document for your records:

- T Building Data Quality Report, Final

If you or members of your staff have any questions regarding the document, or if additional support is needed, please contact Dave Rakel at 937-865-4203.

Sincerely,

Michael D. Ebben

ABSTRACT

T Building is a heavily reinforced underground concrete structure located at the DOE Mound Plant. A CERCLA Removal Action was conducted at the building to remove radiological contamination that resulted from various missions and projects in the building. The removal action segmented the work into 178 survey units. The survey units were organized into 11 groups and a survey plan form was prepared for each grouping. A portion of the survey plan specified the quality control measures necessary to monitor data quality. This report compiles and evaluates the quality control data collected during the T Building Final Status Surveys.

This page intentionally left blank.

1 Historical Overview

T Building is a heavily reinforced underground concrete structure. Construction was completed in 1948. The two main floors are compartmentalized into three general areas (bays) by two 30-inch thick reinforced concrete firewalls. T Building contains more than 200 rooms and 20 corridors. The Core Team authorized the Removal Action via the T Building Action Memorandum (Reference 1) due to radiological contamination from various missions and projects in the building.

The building was constructed by excavating the side of a hill, assembling the basic reinforced concrete building shell, and then back filling the excavated area to essentially the original slope and grade. The interior dimensions of the basic building shell are 345 feet long by 150 feet wide. The roof is 15 feet thick reinforced concrete.

Associated building structures include two exhaust airshafts, which each historically were attached to a two-hundred-foot tall brick and mortar exhaust stack. The exhaust stacks have been demolished. The building has three towers along the north wall, one at each end and one at the center. The end towers contain stairways, passenger elevators, airshafts for intake ventilation air, and pedestrian entrances at grade level. The middle tower was used for providing intake ventilation air. The East Tower also provides space for various utility lines coming into the building. The East and West Towers also contain airshafts that are part of the intake air ventilation system. Large doors permit vehicles and personnel to enter the building at either end of the second floor. The vehicular tunnel extends the length of the south side of the building.

1.1 Past Uses

T-Building was originally built to process radioactive polonium and minor amounts of other radionuclides. From 1949 to 1973, polonium programs included a processing and separation program, fuels research and development program, neutron source program, and a variety of other research, development, and production programs with polonium.

T-Building underwent a significant decontamination in the early 1970s and a substantial modification during the early 1980s in order to accommodate tritium-processing operations. It also contained the Tritium Emissions Recovery Facility that processed tritiated gases to recover waste tritium for disposal. A variety of other activities have taken place in T Building such as nondestructive testing, environmental testing, gamma and mass spectroscopy, calorimetry, neutron activation analysis, and safeguards research and development (R&D). Building operations have included offices and administrative areas, laboratories, and material storage. Materials stored have included chemical products, office supplies, and waste disposal containers. The building also has a vault that was used to store secured nuclear materials.

In 2003, DOE determined that to eliminate the possibility of endangerment as the site transfers from DOE ownership removal of the contaminants in T Building was appropriate.

Planning and execution of the removal action were divided into four phases. The first phase was safe shutdown, characterization, and reduction in contamination or removal

of significantly contaminated rooms and facilities (including tritium-processing areas on both first and second floors) if release criteria could not be met. The second phase was safe shutdown and removal activities of minimally contaminated rooms and facilities, including building service areas and rooms on the first floor with little or no contamination. The third phase was safe shutdown and removal activities of the Radioactive Material Management Areas and Radiological Material Areas (predominately on the second floor) and included rooms where contamination was minimal. The last phase included general building support, final decontamination, hazard mitigation, and characterization and confirmation/ verification activities.

The building has undergone decontamination and decommissioning (D&D) process and is expected to be transferred to the Miamisburg Mound Community Improvement Corporation (MMCIC).

2 Project Overview

The objective of the T Building Verification Sampling and Analysis Plan (VSAP) (Reference 2) was to determine whether or not the residual radioactivity on the building surfaces associated with survey units in T Building meets the surface release criteria. This was accomplished by measuring the fixed and removable contamination on building surfaces and systems. Residual radioactivity levels were evaluated versus established surface release criteria stated in the Work Plan for Environmental Restoration of the DOE Mound Site, The Mound 2000 Approach (hereafter referred to as 'Mound 2000', Reference 3).

The T Building Final Status Survey project was subdivided into manageable pieces called survey units. A total of 175 survey units were developed to address each room and utility system in the building. Eleven survey plans (see Table 1) were developed to address the requirements of the various systems, areas, and potential hazard class. Each survey plan specified the quality control (QC) requirements for the survey units assigned to it. Each Final Status Survey Report includes a copy of the survey plan applicable to the survey units addressed in the report. The survey plans are also reproduced in Attachment 1.

Table 1. T Building Survey Plans

Survey Plan	Description
T-01	Class 1 floors and lower walls and Class 2 ceilings and upper walls in T Building
T-02	Class 2 floors and lower walls and Class 3 ceilings and upper walls in T Building
T-03	Class 3 areas in T Building
T-04	T Building crawlspaces
T-05	Class 1 sumps and associated piping in T Building
T-06	Class 2 sumps and associated piping in T Building
T-07	Utility systems in T Building
T-08	Ventilation exhaust systems in T Building
T-09	Inert gas delivery systems in T Building
T-10	Ventilation supply air systems in T Building
T-11	Volumetric sampling

Associated PRSs

Twenty-seven Potential Release Sites (PRSs) are associated with T Building as listed in Table 2 and include a solidification unit, a waste compactor, and twenty-five sumps/tanks. Each PRS was assigned to a survey unit except for PRS 213 and PRS 214 which had previously been removed and disposed of as radioactive waste. All of these PRSs were decontaminated or removed.

Table 2 - PRSs Associated with T Building

PRS	Description	PRS	Description
213	Solidification unit	227	Alpha waste water sump (Tank 229)
214	Solid radioactive waste compactor	228	Alpha waste water sump (Tank 230)
215	Cooling water sump (Tank 124) Room T-1	229	Alpha waste water sump (Tank 231)
216	Sanitary waste sump (Tank 125) Corridor 2	230	Alpha waste water sump (Tank 232)
217	Sanitary waste sump (Tank 126) Corridor 2	231	Alpha waste water sump (Tank 233)
218	Sanitary waste sump (Tank 127) Corridor 2	232	Alpha waste water sump (Tank 234)
219	Cooling water sump (Tank 128) Stair 3	233	Alpha waste water sump (Tank 235)
220	Steam condensate sump (Tank 129) T-78	339	Waste water sump (Tank 250)
221	Sanitary waste sump (Tank 130)	340	Waste water sump (Tank 251)
222	Sanitary waste sump (Tank 131)	341	Condensate sump (Tank 269) T-90
223	Cooling system condensate sump (Tank 132)	342	Hot side fire water tank (Tank 271) T-1
224	Sanitary waste sump (Tank 133)	343	Fire water sump (Tank 272)
225	Beta waste water sump (Tank 227) T-23	344	Fire water sump (Tank 273)
226	Floor drain sump (Tank 228) T-3		

Survey units were evaluated for fixed and removable radioactive contamination, and levels were compared to the release criteria established for free release to the public. Table 3 provides the radiological surface contamination cleanup objectives for T Building as defined in the Work Plan for Environmental Restoration (Reference 3). A 15 mrem/yr dose limit, excluding naturally occurring radioactive material (NORM) in building materials was used as the contamination clean-up objective where volumetric contamination was found.

Table 3 - Contamination Clean-Up Objectives (dpm/100cm²)¹

Radionuclides ²	Removable ⁵	Maximum ^{5,6}	Average ^{3,4}
Th-natural, Th-232, Sr-90, Ra-223, Ra-224, U-232, I-126, I-131, I-133	200	3,000	1,000
Transuranics, Ra-226, Ra-228, Th-230, Th-228, Pa-231, Ac-227, I-125, I-129	20	300	100
U-Natural, U235, U238 and associated decay products, alpha emitters	1,000	15,000	5,000
Beta-gamma emitters (nuclides with decay modes other than alpha emission or spontaneous fission) except SR-90 and others listed above. Includes mixed fission products containing Sr-90.	1,000	15,000	5,000
Tritium organic compounds, surfaces contaminated by HT, HTO, tritiated particulates, and organically bound tritium.	10,000		N/A

1. As used in this table, dpm (disintegrations per minute) means the rate of emission by radioactive material as determined by counts per minute measured by an appropriate detector for background, efficiency, and geometric factors associated with the instrumentation.
2. Where surface contamination by both alpha- and beta-gamma-emitting radionuclides exist, the limits established for alpha- and beta-gamma-emitting radionuclides should apply independently.
3. Measurements of average contamination should not be averaged over an area of more than 1 m². For objects of less surface area, the area should be derived for each such object.
4. Dose Rate: The average and maximum dose rates associated with surface contamination resulting from beta-gamma emitters should not exceed 0.2 mrad/h and 1.0 mrad/h respectively at 1 cm.
5. The maximum contamination level applies to an area of not more than 100 cm².
6. The amount of removable material per 100 cm² of surface area should be determined by wiping the area of that size with dry filter or soft absorbent paper, applying moderate pressure, and measuring the amount of radioactive material on the wiping with the appropriate instrument of known efficiency. When removable contamination on objects of surface area less than 100 cm² is determined, the activity per unit area should be based on the actual area and the entire surface should be wiped. It is not necessary to use wiping techniques to measure removable contamination levels if direct scan surveys indicate that the total residual surface contamination levels are within the limits for removable contamination.
7. This category of radionuclides includes mixed fission products, including the Sr-90 which is present in them. It does not apply to Sr-90 which has been separated from the other fission products or mixtures where the Sr-90 has been enriched.

All contaminated sumps, trenches, and pipes were removed and disposed of, or decontaminated to levels listed in Table 3, or decontaminated until exposure to future building occupants from residual volumetric contamination meets the dose limit of 15 mrem/yr, excluding NORM in building materials where decontamination is impractical due to volumetric contamination and/or breaches in structural integrity.

Direct alpha and beta scans were performed on 1m² areas around each static measurement. This was accomplished by scanning surrounding surfaces adjacent to the static measurement location such as wall, ceiling, or outer surface of pipe. Where piping was suspended in air the length of the piping was scanned a distance to equal 1m². The ends of piping were uncapped and direct readings were taken at openings and on the external surfaces of the piping.

The utility systems were separate survey units; however as part of the room surveys, utility drops and utility systems were surveyed. The survey for utility drops consists of removing any utility drop covers to fully expose the interior of the utility line. This survey consists of direct measurements for alpha and beta and smears for removable alpha, beta, and tritium. The survey for utility systems in rooms, such as fire water systems, is performed by taking direct measurements for gross alpha and beta activity

and smears for removable alpha, beta, and tritium contamination on the exterior surfaces of the utility system.

The instruments used for radiological surveys were gas flow proportional counters. Alpha/beta fixed point measurements were made with the Ludlum 2350-1 data logger with a 43-68 hand probe. This instrument was also used for scanning walls and small areas. Large area scanning was performed using the Ludlum 2350-1 with a 43-37 floor probe and/or the SHONKA Surface Contamination Monitor (SCM). The scanning instruments were set to alarm at 75% of the applicable guideline values, DCGL_{EMC}, (elevated measurement comparison) for the most restrictive alpha emitter and the most difficult to detect beta emitter. Instrument calibrations and source check data were documented in accordance with Mound procedures.

The ends of piping were uncapped and smears taken at openings. Loose surface contamination was measured by smearing an area of 100 cm² at each data point. Smears were counted for gross alpha/beta activity. Removable tritium contamination was measured by liquid scintillation counting of the smears. Smear results were not combined with the statistical data but compared directly to the removable surface release criteria.

General area exposure rate measurements were performed in the survey units (SUs) using a Micro Rem meter to ensure that the average level of gamma radiation inside the building did not exceed the background level by more than 20 micro R/h.

The Final Status Survey Report documents the end state condition for each Survey Unit. Survey data for each unit was documented on Radiological Survey Data Sheets (RSDS) which were included the Final Status Survey Report for that unit.

2.1 Project Survey Unit Changes

Survey plan T-05 was to address Class 1 sumps in T-Building. Rather than decontaminate and survey the sumps, a decision was made that it would be more economical to simply remove the sumps and piping. Consequently, a quality survey was not required and was not performed for the T-05 survey plan.

3 Quality Control Requirements

The Survey Plans specify the necessary Quality Control (QC) measures for the survey units covered by the plan. The T Building Survey Plan Forms are included as Attachment 1. Measurements and data analysis were performed according to procedures in *MARSSIM Implementing Procedures, Field Quality Control for Building Contamination Surveys, MD-80046, Op. 402* (Reference 4).

Table 4. Survey Plan QC Requirements

QC Requirements
<ul style="list-style-type: none">• Daily morning and evening source checks• Resurvey of 16 fixed locations from all area• Recount of 16 smears from all area• Replicate scan of 5% of area• Maintain chain of custody• Perform alpha and beta surveys before tritium.• Field duplicate for each 10 or fewer samples (T-11 only)• Replicate sample for each 20 samples of similar matrix (T-11 only)

Survey and Sample Quality

QC surveys are performed primarily as verification that the original survey results are valid. QC surveys include replicate surveys and sample recounts. Replicate surveys apply to scan and fixed point surveys. Sample recounts apply to loose surface and material sampling surveys.

Replicate Surveys

A replicate survey is a second set of measurements made in order to establish the variability of a survey. For each survey plan performed, sixteen measurements were taken for fixed point replicate surveys. The data set typically included the highest and lowest activity in the original range. The acceptance criteria for fixed point measurements were that the variance in the measurements of the original sample population is within a factor of two of the variance in the replicate samples. If that was not attained additional evaluation of the data was performed.

The variance in the data set is influenced by a number of factors including atmospheric background levels, survey technique, documentation, and the instrument used. Atmospheric radon and static electricity levels vary from day to day and influence the measurements. The fixed point measurements are conducted under controlled procedures; however, because humans operate the instruments variability is introduced. The degree of precision that the original measurement location is described induces variability. A replicate sample measured a few inches from the original may produce a varied result. There is also variability between the same instruments. Replicate samples are taken with the same make/model of instrument as the original, but not necessarily the same exact device. When the measurements are near background this also contributes to observable variability in the data set.

Replicate Scans (Rescans)

Replicate scan surveys were performed on randomly selected survey units scan surveys. Each of the plan areas T-01 through T-10 is to have 5% of the scanned

surface area replicated. Replicate scan survey results are compared to the original scan results. Agreement for scan surveys is based on the professional judgment. If the same conclusion for scan surveys is not reached further evaluation is required.

Sample Recounts (Smear Results)

Smear sample recounts measure the accuracy and precision of the counting process. The survey plans require that 16 smears be recounted to determine accuracy and precision. Agreement for sample recounts is based on professional judgment. If the same conclusion is not reached for each data set further evaluation is required.

Instrument Checks and Calibration

Radiological survey instrumentation was calibrated periodically using National Institute of Standards and Technology (NIST) traceable sources and controlled in accordance with ANSI-N323a, "Radiation Protection Instrumentation and Calibration". Before each survey, the instrument was checked to verify that its calibration period had not expired.

Survey instrumentation was source checked each day prior to use and again at the completion of survey activities for that day. A known source was placed in a source holder to ensure a reproducible geometry is achieved. Acceptance criterion is +/- 20% of the initial source response following calibration.

The results of the operational checks were documented as part of the daily work activities as required by MD-80036, Radiological Operations Procedures (Reference 6). Calibration due dates were recorded on the RSDS.

Custody of Samples

Samples (smears, scrapings, etc.) that require measurement or counting (i.e. not a field measurement) had controlled custody at all times. Samples sent for offsite analysis were controlled in accordance with Method Q-002 *Chain-of-custody Procedures* located in the *Mound Methods Compendium* (See 2.2.2). When samples were transferred to the on-site laboratory the on-site laboratory chain of custody procedures were followed.

The base unit for the performance of field surveys was the Ludlum 2350 or 2350-1. The 2350 or 2350-1 is a data-logging instrument that accepts a variety of detectors. Survey data (survey point, survey type, measurement value, etc.) are recorded in the instrument's memory. Upon completion of surveys the data in the instrument are downloaded to a computer. The data is then reviewed, verified, and analyzed. The 2350 or 2350-1 was pre-programmed to accept probes, control count times, and note survey points before it was issued to the technician performing the survey. The instrument remained under the control of the technician until collected data were downloaded or the instrument transferred to the designated individual for download.

Log sheets and other forms used to record field data remained under the control of the assigned RCT until placed in secure storage.

QC Survey Discrepancies

MD-80036 (Reference 6) requires that investigations are performed when discrepancies arise as a result of comparing QC survey data to original Final Status

Survey (FSS) data. The investigation is performed by or at the direction of the RPOC. A Radiological Awareness Report (RAR) may be initiated if the findings of the investigation indicate that the decision of the radiological status of the survey unit would have been adversely affected had the discrepancy gone undetected or at the discretion of the RPOC. The RPOC maintains a record of all QC survey discrepancies.

Determining Accuracy and Precision for Sample Recounts

To evaluate the accuracy for sample recounts, the resolution for each original sample count was determined by dividing the count activity by its corresponding 1 sigma uncertainty. Next, the agreement ratio was calculated by dividing the sample recount value by the original sample value. The results are deemed acceptable if the agreement ratio falls within the values given in the following table for the corresponding resolution. Otherwise additional evaluation was required.

Table 5. Accuracy Evaluation Criteria.

RESOLUTION	AGREEMENT RATIO
< 4	No Comparison
4 – 7	0.5 – 2.0
8 – 15	0.6 – 1.66
16 – 50	0.75 – 1.33
51 – 200	0.80 – 1.25
> 200	0.85 – 1.18

See Attachment A of MARSSIM Implementing Procedures, Field Quality Control for Building Contamination Surveys (Reference 4) for more details on this procedure.

To evaluate the precision for sample recounts, the mean value for each pair of counts was calculated. Next the percent deviation from the mean value was determined for each pair of counts using the following formula:

$$\text{Percent Deviation} = (\text{Recount value} - \text{mean value}) / \text{mean value} \times 100$$

An adequately low percent deviation indicates that the count and recount are in agreement. This is based on professional judgment on a case-by-case basis. A typical acceptable percent deviation is 20%. See Attachment A of MARSSIM Implementing Procedures, Field Quality Control for Building Contamination Surveys (Reference 4) for more details on this procedure.

3.1 Quality Control Results

3.1.1 QC Completeness

Table 6 summarizes the quality measurements that were performed for T Building.

3.1.2 QC Results for T-01

3.1.2.1 Replicate Surveys

Sixteen data points were selected for fixed replicate surveys from the sample group collected in the class 1 areas. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-307) were taken at these locations and performed in the same manner as the original survey. Table 7 compares the QC sample results the initial sample results.

Table 7. T-01 Fixed Replicate Point Variance Analysis

Ratio				0.58		0.52
Agreement				YES		YES

3.1.2.2 Replicate Scans

Replicate Scans were conducted for Class 1 areas per the T-01 survey plan. On the first floor 174,871 sq. ft. of area were scanned. Replicate scans were performed on survey units 1S10, 1S12, 1C18, and 1N02B (RSDSs MT-06-0264, MT-05-0860, MT-06-0223, MT-06-0249, MT-05-0944). These units were randomly selected from a list

of all first floor survey units. The selected survey units cover 4,580 sq. ft. On the second floor survey units 2C07, 2N05A, 5N06 were rescanned (RSDSs MT-06-0235, MT-06-0258, MT-06-0251). These units comprise 5,626 sq. ft. while the total area surveyed on the second floor was 190,276 sq. ft.

No elevated alpha or beta readings were detected in any of the rescans. These results are in agreement with the original findings. It should be noted that in the case of survey unit 1S10 rooms 16b and 17 were selected for rescan. The original scan of rooms 16b and 17 noted five potentially elevated readings. Follow-up fixed point surveys of the suspected elevated areas did not detect levels above release criteria (RSDS MT-05-044).

3.1.2.3 Sample Recounts

Recounts were performed on smears samples taken at the sixteen QC measurement locations. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

3.1.2.4 Conclusions

Fixed replicate survey results met the statistical criteria for agreement because the variance of the original data set and the replicate data set were within a factor of 2. Therefore, the fixed measurement initial and replicate data are in agreement.

No elevated alpha or beta readings were observed during the rescan. These results are in agreement with the original scan findings reported in the final survey status report. No further investigation is required.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-01.

3.1.3 QC Results for T-02

3.1.3.1 Replicate Surveys

Sixteen data points were selected for fixed replicate surveys from the sample group collected in the class 2 areas. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-0311) were

taken at these locations. Table 10 compares the replicate survey results to the originally measured values.

T02QC16	2S030119S	06-0024	West Tunnel	34	19	1196	1800
Variance				680	237	512542	549707
Ratio					2.9		0.9
Agreement					NO		YES

With data sets containing measurements that are significantly greater than background, the variance of the initial data set should generally be within a factor of 2 of the variance of the replicate data set. With the data above, the majority of the measurements are indistinguishable from natural background, i.e. statistically insignificant. Given this situation, the two data sets agree reasonably well. In both sets of measurements, all values are below the release guidelines of 100 dpm/100 cm² alpha and 5,000 dpm/100 cm² beta.

3.1.3.2 Replicate Scans

Replicate scans were performed on survey units 2N01, 1S02, 5N02, and 2N02 (RSDSs MT-06-0260, MT-06-0262, MT-06-0265, MT-06-0268). These units were randomly selected from a list of all Class 2 survey units. These units comprise 5,154 sq. ft. while the total Class 2 area surveyed was 133,158 sq. ft.

No elevated alpha or beta readings were detected in any of the rescans or in the scans reported in the final survey status reports for these units.

3.1.3.3 Sample Recounts

Recounts were performed on smear samples taken at the sixteen QC measurement locations. The recounted samples were evaluated for accuracy and precision. The recounted samples were compared to the original measurements for accuracy and precision as shown in Tables 11 and 12 below.

3.1.3.4 Conclusions

Fixed replicate survey data sets agree reasonably well considering that all measurements are near background. All values in both data sets are below release criteria. There are no anomalies that cause concern with the original data set.

No elevated alpha or beta readings were observed during the rescan. That result agrees with the original scan findings reported in the final survey status reports.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-02.

3.1.4 QC Results for T-03

3.1.4.1 Replicate Surveys

Sixteen data points were selected for fixed replicate surveys from the sample group collected in class 3 areas. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-0525, MT-06-595) were taken at these locations. Table 13 compares the replicate survey results to the originally measured value.

Table 13. T-03 Fixed Replicate Point Variance Analysis

T03QC14	5N030104J	05-904	74	91	2441	3304
T03QC15	0504S12J	05-902	134	102	3863	4067
T03QC16	2S180214J	05-820	95	45	2555	1687
Variance			3757	1547	1483037	1660337
Ratio				2.4		0.9
Agreement				NO		YES

With data sets containing measurements that are significantly greater than background, the statistical criteria for agreement is that the variance of the initial data set be within a factor of 2 of the variance of the replicate data set. Variance of the alpha data set is slightly higher than that.

3.1.4.2 Replicate Scans

A replicate scan (RSDS MT-06-0301) of survey unit 1N05 was conducted. 1N05 was selected because it was the only survey unit within the T-03 plan that was conducted inside the building. 5,092 sq. ft. were rescanned. No elevated alpha or beta readings were detected during the rescan or during the original scan.

3.1.4.3 Sample Recounts

Recounts were performed on smear samples taken at the sixteen QC measurement locations. The recounted samples were evaluated for accuracy and precision. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

Table 14. Accuracy Determination For T-03 Sample Recounts

3.1.4.4 Conclusions

The variance test for fixed replicate survey data does not pass; therefore, the data were evaluated per MD80046, Operation 402. No discrepancies were found in the data collection or documentation. The data were determined to be usable.

No elevated alpha or beta readings were observed during the rescan. That result agrees with the original scan findings reported in the final survey status report.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-03.

3.1.5 QC Results for T-04

3.1.5.1 Replicate Surveys

Sixteen data points were selected for fixed replicate surveys from the sample group collected in the crawlspace areas. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-0522) were taken at these locations. The original measurements are recorded in the Final Status Reports for the survey units 2CS0201, 2CS0301, 1CS0301, 2CS0101, 2CS0102, 2CS0303, 1CS0201, 2CS0302, and 2CS0202 (References 11, 12, 13). Table 16 compares the replicate survey results to the originally measured value.

3.1.5.2 Replicate Scans

Replicate scans were conducted in the crawlspace in the area of the points selected for fixed replicate survey. A one meter radius around the point was re-scanned on the

floor and ceiling of the crawlspace at the survey locations. Also, any pipes or ductwork passing above the one meter area were re-scanned. No elevated alpha or beta readings were detected in either the replicate or original scans.

3.1.5.3 Sample Recounts

Recounts were performed on smears samples taken at the sixteen QC measurement locations. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

3.1.5.4 Conclusions

Fixed replicate survey data sets agree reasonably well. All values in both data sets are below release criteria and are in qualitative agreement. The variance test for fixed replicate survey data does not pass; therefore, the data were evaluated per MD80046, Operation 402. No discrepancies were found in the data collection or documentation. The data were determined to be usable. There are no anomalies that cause concern with the original data set.

No elevated alpha or beta readings were observed during the rescan. That result agrees with the original scan findings reported in the final survey status report.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-04.

3.1.6 QC Results for T-05

Quality control surveys were not performed for the T-05 survey plan because the equipment was removed.

3.1.7 QC Results for T-06

3.1.7.1 Replicate Surveys

Sixteen data points were selected at random for fixed replicate surveys from the sample group collected at the class 2 sumps. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-0435) were taken at these locations. The initial values are reported in the Final Status Report for survey units 1S01, SYSPRS215, SYSPRS342, and SYSPRS223 (References 14, 15,

and 16). Table 19 compares the replicate survey results to the originally measured value.

Ratio				0.84		1.9
Agreement				YES		YES

3.1.7.2 Replicate Scans

Replicate scans were not performed for the T-06 survey plan because the surface area of the sumps is sufficiently small that the fixed survey points provide adequate coverage of the area under investigation.

3.1.7.3 Sample Recounts

Recounts were performed on smears samples taken at the sixteen QC measurement locations. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

3.1.7.4 Conclusions

Fixed replicate survey data meet the statistical requirement for agreement. There are no anomalies that cause concern with the original data set.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-06.

3.1.8 QC Results for T-07

3.1.8.1 Replicate Fixed Point Surveys

Sixteen data points were selected at random for fixed replicate surveys from the sample group collected for T-07 survey units. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-0522) were taken at these locations. The initial results are reported in the Final Status Report for survey unit #s SYS-13, SYS-14, SYS-15, SYS-16, SYS-17, SYS-18, SYS-19, SYS-20 and SYS-21 (References 5, 9). The results of the initial and replicate surveys are presented in Table 22.

3.1.8.2 Replicate Scans

Replicate scans were performed (RSDS MT-06-0324) for the liquid utility piping systems as designated under survey plan. Scans were conducted within a 1 meter area around each of the 16 points selected for the fixed replicate survey. The 16 points included the locations of the maximum and minimum alpha and beta measurements from the original survey. The 16 rescans exceed the 5 required to meet the 5% requirement specified in the T-07 survey plan. No elevated alpha or beta readings were detected during the rescans. That result is consistent with the result presented in Final Status Reports (References 5, 9) which also did not detect elevated alpha or beta.

3.1.8.3 Sample Recounts

Recounts were performed on smears samples taken at the sixteen QC measurement locations. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

3.1.8.4 Conclusions

The variance test for fixed replicate survey data does not pass; therefore, the data were evaluated per MD80046, Operation 402. No discrepancies were found in the data collection or documentation. The data were determined to be usable. The alpha data sets are in qualitative agreement. All values from both data sets are below the release guideline of 100 dpm/100 cm² alpha. The beta result sets demonstrate close agreement.

No elevated alpha or beta readings were observed during the rescan. These results are in agreement with the original scan findings reported in the final survey status report.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha and beta measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies. There were five above background data points in the tritium data set (measurements 3, 7, 8, 14 and 15). These results meet the VSAP requirement for accuracy listed in Table 5. They also have a percent deviation near 10% showing reasonably good precision.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-07.

3.1.9 QC Results for T-08

3.1.9.1 Replicate Surveys

Sixteen data points were selected at random for fixed replicate surveys from the sample group collected for exhaust ventilation survey units. The set included the highest alpha and beta measurements and the lowest alpha and beta measurements. The remaining 12 points were selected at random. Replicate measurements (RSDS MT-06-0545) were taken at these locations. The initial results are reported in the Final Status Report for survey unit #s SYS-05, SYS-05-01, SYS-05-02, SYS-06, SYS-06-01, SYS-06-02, and SYS-06-04 (References 17, 18). The results of the initial and replicate surveys are presented in Table 22.

Variance			1496	1025	194319	682032
Ratio				1.5		0.28
Agreement				YES		NO

(a) The RSDS did not clearly identify the corresponding initial fixed survey location. This point was disregarded when determining the variance.

3.1.9.2 Replicate Scans

Replicate scans were performed (RSDS MT-06-0545) for the exhaust ventilation systems as designated under survey plan. Scans were conducted within a 1 meter area around each of the 16 points selected for the fixed replicate survey. The 16 points included the locations of the maximum and minimum alpha and beta measurements from the original survey.

Slightly elevated readings for alpha were observed during the rescan. The original scan findings also reported slightly elevated alpha results. Agreement was not ideal because one of the elevated replicate measurements was not reflected in the initial measurements and one of the elevated initial measurements was not reflected in the replicates. The exhaust ventilation system is active and fluctuation of contaminant readings is expected.

3.1.9.3 Sample Recounts

Recounts were performed on smears samples taken at the sixteen QC measurement locations. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

3.1.9.4 Conclusions

The variance test for fixed replicate survey data does not pass; therefore, the data were evaluated per MD80046, Operation 402. No discrepancies were found in the data collection or documentation. The data were determined to be usable. There are no anomalies that cause concern with the original data set.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies. Two tritium results, samples 13 and 14, are noteworthy because the measurements are above background and deviate by less than 10%. This demonstrates that when levels are above background the measurement process produces consistent results.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-08.

3.1.10 QC Results for T-09

3.1.10.1 Replicate Fixed Point Surveys

Sixteen data points were selected at random from the group of fixed survey data points collected for the survey units associated with T-09. Replicate measurements (RSDS MT-06-0319) were taken at these locations in the same manner as the original survey. The original survey is documented in the Final Status Report for SYS-07, SYS-08, SYS-09, SYS-10, SYS-11 and SYS-12 (Reference 7). The results of the replicate survey are presented in Table 28.

3.1.10.2 Replicate Scans

The T-09 Survey Plan requires that 5% of the scan measurements taken on the inert gas delivery systems be randomly selected for replicate scan. Replicate scans were conducted within a 1 meter area around each of the 16 points selected for the fixed replicate survey. The 16 rescan measurements exceed the 6 required to meet the 5% requirement specified in the T-09 survey plan and the 16 points include the locations of the maximum and minimum original alpha and beta measurements. No elevated alpha or beta readings were observed during the rescan. The results are in agreement with the original findings reported in the final survey status report (Reference 7).

3.1.10.3 Sample Recounts

Recounts were performed on smears samples taken at the sixteen QC measurement locations as presented in RSDS #MT-06-0319. The recounted samples were evaluated for accuracy and precision. The recounted samples were compared to the original measurements for accuracy and precision as shown below.

3.1.10.4 Conclusions

The variance test for fixed replicate survey data does not pass; therefore, the data were evaluated per MD80046, Operation 402. No discrepancies were found in the data collection or documentation. The data were determined to be usable. All values are in qualitative agreement and are below the release guidelines of 100 dpm/100 cm² alpha and 5,000 dpm/100 cm² beta.

No elevated alpha or beta readings were observed during the rescan. These results are in agreement with the original scan findings reported in the final survey status report. No further investigation is required, and the data are usable.

Sample (smear) recount results were assessed for both accuracy and precision. All original and recounted alpha, beta, and tritium measurements (except for two tritium measurements) were at or near background. Consequently, accuracy and precision statistics were adversely affected.

All alpha original and recounted samples were counted at background (0). While the data sets have perfect agreement, comparison of data sets where there are no

detections cannot be used to quantitatively assess accuracy or precision. Inspection of the results shows agreement between the data sets indicating the counting equipment produced repeatable results. All of the beta measurements are also at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies. There were two above background data points in the tritium data set (measurements 7 and 9). These results meet the requirement for accuracy – agreement ratio greater than 0.6 and less than 1.6. They also have a percent deviation less than 10% showing good precision.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-09.

3.1.11 QC Results for T-10

3.1.11.1 Replicate Surveys

Sixteen data points were selected at random from the group of fixed survey data points collected for the survey units associated with T-10. Replicate measurements (RSDS MT-06-0543) were taken at these locations in the same manner as the original survey. The original survey is documented in the Final Status Report for survey units 2S-06, 1S-12, SYS-03, SYS-04 and SYS-16 (Reference 10). The results of the replicate survey are presented in Table 31.

3.1.11.2 Replicate Scans

A replicate scan was performed at each of the 16 points randomly selected as fixed replicate survey samples. One square meter of area was re-scanned around each point (RSDS MT-06-0543). No elevated alpha or beta readings were detected. In the

original scans an elevated reading was observed around points SYS04S23AJ and SYS043101.

3.1.11.4 Conclusions

The variance test for fixed replicate survey data does not pass; therefore, the data were evaluated per MD80046, Operation 402. No discrepancies were found in the data collection or documentation. The data were determined to be usable.

No elevated alpha or beta readings were observed during the rescan. Fourteen of sixteen replicate results agree with the original scan findings reported in the final survey status report.

Sample (smear) recount results were assessed for both accuracy and precision. All of the alpha, beta, and tritium measurements are at or near background so the statistical evaluation of accuracy and precision of these results is not meaningful. It is noteworthy that sample 12 had an elevated count for tritium which is echoed in both data sets. The results are in qualitative agreement in that all of the measurements, original and recounted, are near background with no anomalies.

Based on the results of the quality control tests, there is no reason to suspect data quality problems in the original data collected for survey units assigned to survey plan T-10.

3.1.12 QC Results for T-11

3.1.12.1 Field Duplicate

A field sample from room T-48 was split and analyzed as samples 0600453 and 0600454. The detections are summarized below and the laboratory soil analysis reports are included in Attachment 3.

Table 34. Field Duplicate Detections for T-11.

Radionuclide	0600453 Activity (pCi/g)	0600453 MDA	0600454 Activity (pCi/g)	0600454 MDA
Co-60	22.15	0.22	80.48	0.69
Cs-137	0.37	0.26	.84	0.35

3.1.12.2 Replicate sample

A replicate sample, 0600460, was collected at the same location as samples shown in Table 34. The detections for sample 0600460 are presented in Table 35. The laboratory soil analysis reports are included in Attachment 3.

Table 35. Field Replicate Detections for T-11.

Radionuclide	0600460 Activity (pCi/g)	0600460 MDA
Co-60	104.1	0.32
Cs-137	1.97	0.22

3.1.12.3 Conclusions

The results between the duplicates (0600453 and 0600454) vary. The field duplicate samples appear to be non-homogeneous. The mean result of the duplicates varies from the replicate (0600460). The replicate sample is from different material than the field duplicates. Contamination is spotty and is not distributed uniformly through the concrete. Therefore, the QC results are inconclusive.

3.1.13 General Observations

3.1.13.1 Instrument Calibration

A review of all T Building RSDS records was conducted to establish whether some RSDSs recorded the wrong instrument calibration due dates or whether out of calibration instruments had been used. The calibration due date recorded on the RSDS was compared to the instrument calibration log book to establish the instrument calibration due date at the time of the survey.

A number of recording errors were discovered and corrected during the process. The corrected RSDS sheets are included as Attachment 4. No instances of use of an out of calibration instrument were discovered.

		PROBE TYPE			
COMMENTS AND GENERAL REQUIREMENTS	All surveys shall be performed and documented in accordance with Mound Radiological Control procedures. Perform scan surveys prior to fixed-point surveys. Ensure building surfaces are clean and free of loose debris, dirt, and obstructions prior to performing surveys. Rad Con shall document all discrepancies from the above sampling and surveying instructions on the RSDS.				

Continued next page

1 - 1/49

Specific Sampling and Survey Instructions Continued**Safety Considerations**

1. Obtain assistance from the responsible building custodian for access to upper walls, ceilings, roof, etc.
2. Exercise extreme caution when performing surveys from ladders, lifts, or scaffolds.
3. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.
4. Ensure ventilation units are de-energized prior to attempting to collect a sample from them.
5. Obtain approval and assistance from the responsible building custodian to dismantle any equipment for sample collection.
6. Use L2360 if locations are not safely accessible using the L2350 (e.g. close tight spaces, on top roofs, etc).

Scanning using Ludlum 2350-1 with 43-37 (floor) and 43-68 (hand) probes

1. Verify that the rate meters are set to alarm at or below 225 dpm/100 cm² alpha and 11250 dpm/100 cm² beta. (The RPOC or Rad Engineer will provide cpm values for alarm set points).
2. Scan at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
3. Perform a static measurement at every location where an indication of elevated activity is observed.
4. Record the locations and document the results of the area scanned on the RSDS.

Scanning using Ludlum 2360 with 43-89 probe

1. Scan in accordance with instrument procedures at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
2. Perform a static measurement at every location where an indication of elevated activity is observed.
3. Record the locations and document the results of the area scanned on the RSDS.

Scanning using SHONKA Position Sensitive Proportional Counter (PSPC) with 2', 4' and 6' probes

1. Scan in accordance with instrument procedures at a rate of 0.4 inch per sec for alpha and 4.0 inch per sec for beta, at a distance of not more than ¼ " from the surface.
2. Perform a static measurement at every location where an indication of elevated activity is observed.
3. Record the locations and document the results of the area scanned on the RSDS.

Continued next page

1 - 2/49

Specific Sampling and Survey Instructions Continued**Scanning in Class 1 areas**

1. Scan 100% of the floor and walls up to 2 meters

Scanning in Class 2 areas

1. Scan at least 25% of walls above 2 meters using a serpentine pattern with scan paths spaced three probe widths apart.
2. On ceilings and in crawlspaces, scan an area of approximately 1 m² around each static measurement location.

Static measurements

1. When using hand probes, the count time is 2 min for alpha measurements and 1 min for beta measurements. When using the floor probe, the count time for alpha and beta measurements is 30 sec.
2. Perform integrated counts at all pre-designated sample location and at any elevated locations identified by scanning.
3. Perform at least 10 measurements on beams, supports, or other horizontal structural surfaces in each survey unit where, in the judgment of the surveyor, a potential exists for residual contamination.
4. Record the location and document the results on the RSDS in accordance with Mound Rad Con procedures.
5. Document the gross activity for each location (no "<" or ">" values).

Data Point Location

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

General Area Exposure Rate Measurements

1. Perform general area exposure rate measurement using Micro Rem survey meter in each room in the survey unit at a distance of 1 meter (m) from the floor.
2. Record reading results (microRem/hr) including background on RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

Loose Surface Contamination

1. Obtain a smear of 100cm² at each pre-designated static measurement location.
2. Count each smear for alpha, beta, and ³H.
3. Record location and attach results on the RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

Continued next page

1-3/49

Specific Sampling and Survey Instructions Continued

Quality Control

1. Check Configuration Index (CI) for latest revision of procedures.
2. Daily source checks will be performed at the beginning and end of each day in accordance with Mound Rad Con procedures.
3. 16 fixed measurement data points will be selected for resurvey from the pool of Class 1 areas. Data points selected for resurvey should include the highest and lowest measurement from the data pool.
4. 16 smears will be randomly selected for recount from the pool of Class 1 areas.
5. 5% of the scan measurements taken in Class 1 areas will randomly be selected for replicate scan surveys.
6. Follow Rad Con procedures for Chain of Custody requirements.
7. Ensure alpha and beta smear results are obtained before performing ³H analysis.
8. Record location and results on the RSDS in accordance with Mound Rad Con procedures.

1-7/49

Specific Sampling and Survey Instructions Continued**Safety Considerations**

1. Obtain assistance from the responsible building custodian for access to upper walls, ceilings, roof, etc.
2. Exercise extreme caution when performing surveys from ladders, lifts, or scaffolds.
3. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.
4. Ensure ventilation units are de-energized prior to attempting to collect a sample from them.
5. Obtain approval and assistance from the responsible building custodian to dismantle any equipment for sample collection.
6. Use L2360 if locations are not safely accessible using the L2350 (e.g. close tight spaces, on top roofs, etc).

Scanning using Ludlum 2350-1 with 43-37 (floor) and 43-68 (hand) probes

1. Verify that the rate meters are set to alarm at or below 225 dpm/100 cm² alpha and 11250 dpm/100 cm² beta. (The RPOC or Rad Engineer will provide cpm values for alarm set points).
2. Scan at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
3. Perform a static measurement at every location where an indication of elevated activity is observed.
4. Record the locations and document the results of the area scanned on the RSDS.

Scanning using Ludlum 2360 with 43-89 probe

1. Scan in accordance with instrument procedures at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
2. Perform a static measurement at every location where an indication of elevated activity is observed.
3. Record the locations and document the results of the area scanned on the RSDS.

Scanning using SHONKA Position Sensitive Proportional Counter (PSPC) with 2',4' and 6' probes

1. Scan in accordance with instrument procedures at a rate of 0.4 inch per sec for alpha and 4.0 inch per sec for beta, at a distance of not more than ¼ " from the surface.
2. Perform a static measurement at every location where an indication of elevated activity is observed.
3. Record the locations and document the results of the area scanned on the RSDS.

Continued next page

1 - 8/49

Specific Sampling and Survey Instructions Continued**Scanning in Class 2 areas**

1. Scan 100% of the floor and 50% of the walls up to 2 meters using a serpentine pattern with scan paths spaced one probe width apart.

Scanning in Class 3 areas

1. Scan at least 25% of walls above 2 meters using a serpentine pattern with scan paths spaced three probe widths apart.
2. On ceilings and in crawlspaces, scan an area of approximately 1 m² around each static measurement location.

Static measurements

1. When using hand probes, the count time is 2 min for alpha measurements and 1 min for beta measurements. When using the floor probe, the count time for alpha and beta measurements is 30 sec.
2. Perform integrated counts at all pre-designated sample location and at any elevated locations identified by scanning.
3. Perform at least 10 measurements on beams, supports, or other horizontal structural surfaces in each survey unit where, in the judgment of the surveyor, a potential exists for residual contamination.
4. Record the location and document the results on the RSDS in accordance with Mound Rad Con procedures.
5. Document the gross activity for each location (no "<" or ">" values).

Data Point Location

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

General Area Exposure Rate Measurements

1. Perform general area exposure rate measurement using Micro Rem survey meter in each room in the survey unit at a distance of 1 meter (m) from the floor.
2. Record reading results (microRem/hr) including background on RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

Loose Surface Contamination

1. Obtain a smear of 100cm² at each pre-designated static measurement location.
2. Count each smear for alpha, beta, and ³H.
3. Record location and attach results on the RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

SPECIFIC SAMPLING / SURVEY INSTRUCTIONS**Specific Sampling and Survey Instructions Continued****Safety Considerations**

1. Obtain assistance from the responsible building custodian for access to upper walls, ceilings, roof, etc.
2. Exercise extreme caution when performing surveys from ladders, lifts, or scaffolds.
3. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.
4. Ensure ventilation units are de-energized prior to attempting to collect a sample from them.
5. Obtain approval and assistance from the responsible building custodian to dismantle any equipment for sample collection.
6. Use L2360 if locations are not safely accessible using the L2350 (e.g. close tight spaces, on top roofs, etc).

Data Point

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

Static Measurements

1. When using hand probes, the count time is 2 min for alpha measurements and 1 min for beta measurements.
2. Perform integrated counts at 20 pre-designated sample locations in each survey unit and at any elevated locations identified by scanning.
3. Perform at least 30 biased location measurements in areas considered likely to accumulate contamination. Seek assistance choosing biased sample locations from the project engineer or rad engineer.
4. At each static measurement location, take an alpha and beta measurement.
5. Record the location and document the results on the RSDS in accordance with Mound Rad Con procedures.
6. Document the gross activity for each location (no "<" or ">" values).

General Area Exposure Rate Measurements

1. Perform general area exposure rate measurements using Micro Rem survey meter in each room in the survey unit at a distance of 1 meter (m) from the floor.
2. Record reading results (microRem) including background on the RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

COMMENTS AND GENERAL REQUIREMENTS

Class 1 sumps and associated piping are excavated and disposed of as radioactive waste. They are not to be surveyed and released. This SPF addresses surveys performed in excavated sump pits and empty pipe chases.

All surveys shall be performed and documented in accordance with Mound Radiological Control procedures.

Perform scan surveys prior to fixed-point surveys.

Rad Con shall document all discrepancies from the above sampling and surveying instructions on the RSDS.

Continued next page

1-22/49

Safety Considerations

1. Obtain assistance from the responsible building custodian for access to sumps.
2. Exercise extreme caution when performing surveys inside sump area.
3. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.

Scanning using Ludlum 2350-1 with 43-68 hand probe

1. Verify that the rate meters are set to alarm at or below 225 dpm/100 cm² alpha and 11250 dpm/100 cm² beta. (The RPOC or Rad Engineer will provide cpm values for alarm set points).
2. Scan at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
3. Perform a static measurement at every location where an indication of elevated activity is observed.
4. Record the locations and document the results of the area scanned on the RSDS.
5. Use L2360 with Fidler probe if surfaces are too uneven to use L2350.

Scanning in Class 1 areas

Scan 100% of the sump pit and empty drain chases.

Surface Scan Using a Ludlum 2360 with a Fidler probe

1. Scan the sump pit and empty drain chase surfaces at a rate of 2.5" per second.
2. Record the locations of the area scanned on the RSDS and document the results in accordance with Mound Rad Con procedures (no "<" or ">" values).

General Area Exposure Rate Measurements

1. Perform general area exposure rate measurement using a Micro Rem survey meter for each sump at a distance of 1m from the surface.
2. Record reading results (microRem/hr) on RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

Data Point Location

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

Continued next page

1-23/49

Specific Sampling and Survey Instructions Continued**Static measurements**

1. The count time for static measurements using the hand probe is 2 min for alpha and 1 min for beta.
2. Perform integrated counts at each sample location.
3. Record location, material type, and results on RSDS in accordance with Mound Rad Con procedures.
4. Document gross activity for each location (no "<" or ">" values).

Loose Surface Contamination

1. Obtain a smear of 100 cm² at each survey point identified above.
2. Count each smear for alpha, beta, and ³H.
3. Record location and results on RSDS map in accordance with Mound Rad Con procedures.

COMMENTS AND GENERAL REQUIREMENTS

All surveys shall be performed and documented in accordance with Mound Radiological Control procedures.

Perform scan surveys prior to fixed-point surveys.

Ensure building surfaces are clean and free of loose debris, dirt, and obstructions prior to performing surveys.

Rad Con shall document all discrepancies from the above sampling and surveying instructions on the RSDS.

1-27/49

Specific Sampling and Survey Instructions Continued**Safety Considerations**

1. Obtain assistance from the responsible building custodian for access to sumps.
2. Exercise extreme caution when performing surveys inside sump area. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.

Scanning using Ludlum 2350-1 with 43-68 hand probe

1. Verify that the rate meters are set to alarm at or below 225 dpm/100 cm² alpha and 11250 dpm/100 cm² beta. (The RPOC or Rad Engineer will provide cpm values for alarm set points).
2. Scan at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
3. Perform a static measurement at every location where an indication of elevated activity is observed.
4. Record the locations and document the results of the area scanned on the RSDS.
5. Record the locations and document the results of any integrated counts on the RSDS.
6. Document the gross activity for each location (no "<" or ">" values).

Scanning using Ludlum 2360 with 43-89 probe

1. Scan in accordance with instrument procedures at a rate of ½ inch per sec.
2. Perform a static measurement at every location where an indication of elevated activity is observed.
3. Record the locations and document the results of the area scanned on the RSDS.
4. Record the locations and document the results of any integrated counts on the RSDS.
5. Document the gross activity for each location (no "<" or ">" values).

Scanning

1. Scan 100% of all dry accessible surfaces with the L-2350-1 with 43-68 hand probe.
2. Record the locations of the area scanned on the RSDS.

Continued next page

1 - 28/49

Specific Sampling and Survey Instructions Continued**Surface Scan Using a Ludlum 2360 with a Fidler probe**

1. If the sump has been physically removed, scan the sump pit and any accessible drain pipe locations at a rate of 2.5" per second.
2. Record the locations of the area scanned on the RSDS and document the results in accordance with Mound Rad Con procedures (no "<" or ">" values).

General Area Exposure Rate Measurements

1. Perform general area exposure rate measurement using Bicon Micro Rem survey meter for each sump at a distance of 1m from the surface.
2. Record reading results (microRem/hr) on RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

Data Point Location

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

Static measurements

1. When using hand probes, the count time is 2 min for alpha measurements and 1 min for beta measurements. When using the floor probe, the count time for alpha and beta measurements is 30 sec.
2. Perform integrated counts at each sample location.
3. Record location, material type, and results on RSDS in accordance with Mound Rad Con procedures.
4. Document gross activity for each location (no "<" or ">" values).

Loose Surface Contamination

1. Obtain a smear of 100 cm² at each survey point identified above.
2. Count each smear for alpha, beta, and ³H.
3. Record location and results on RSDS map in accordance with Mound Rad Con procedures.

Specific Sampling and Survey Instructions Continued

QUALITY CONTROL

1. Check Configuration Index (CI) for latest revision of procedures.
2. Daily source checks will be performed at the beginning and end of each day in accordance with Mound Rad Con procedures.
3. 16 fixed measurement data points will be selected for resurvey from the Class 2 sumps. Data points selected for resurvey should include the highest and lowest measurement from the data pool
4. 16 smears will be randomly selected for recount from the Class 2 sumps.
5. 5% of the scan measurements taken in Class 2 sumps will randomly be selected for replicate scan surveys in accordance with MD-80046, Op 402.
6. Follow Rad Con procedures for Chain of Custody requirements.
7. Ensure alpha and beta smear results are obtained before performing ³H analysis.
8. Record location, material, and results on RSDS in accordance with Mound Rad Con procedures.

COMMENTS

Visually inspect the sump to determine if an area of breached integrity exists. Contact Radiological Engineer or RPOC to determine if additional measurements or instrumentation is needed, if there is evidence of a breach in the integrity of the sump. A smear or additional sampling of the breached area may be required.

SPECIFIC SAMPLING / SURVEY INSTRUCTIONS**Specific Sampling and Survey Instructions Continued****Safety Considerations**

1. Obtain assistance from the responsible building custodian for access to upper walls, ceilings, roof, etc.
2. Exercise extreme caution when performing surveys from ladders, lifts, or scaffolds.
3. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.
4. Ensure ventilation units are de-energized prior to attempting to collect a sample from them.
5. Obtain approval and assistance from the responsible building custodian to dismantle any equipment for sample collection.
6. Use L2360 if locations are not safely accessible using the L2350 (e.g. close tight spaces, on top roofs, etc).

Data Point

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

Static measurements

1. When using hand probes, the count time is 2 min for alpha measurements and 1 min for beta measurements.
2. Perform integrated counts at 20 pre-designated sample locations in each survey unit and at any elevated locations identified by scanning.
3. Perform at least 30 biased location measurements in areas considered likely to accumulate contamination, such as sharp bends inside ducting. Seek assistance choosing biased sample locations from the project engineer or rad engineer.
4. At each static measurement location, take a alpha and beta measurement, clean the surface and then repeat the alpha measurement on the cleaned surface.
5. Record the location and document the results on the RSDS in accordance with Mound Rad Con procedures.
6. Document the gross activity for each location (no "<" or ">" values).

COMMENTS AND GENERAL REQUIREMENTS	All surveys shall be performed and documented in accordance with Mound Radiological Control procedures.				
	Rad Con shall document all discrepancies from the above sampling and surveying instructions on the RSDS.				

Continued next page

1 - 43/49

SPECIFIC SAMPLING / SURVEY INSTRUCTIONS**Specific Sampling and Survey Instructions Continued****Safety Considerations**

1. Obtain assistance from the responsible building custodian for access to upper walls, ceilings, roof, etc.
2. Exercise extreme caution when performing surveys from ladders, lifts, or scaffolds.
3. Follow appropriate site safety procedures when accessing areas requiring fall protection measures.
4. Ensure ventilation units are de-energized prior to attempting to collect a sample from them.
5. Obtain approval and assistance from the responsible building custodian to dismantle any equipment for sample collection.
6. Use L2360 if locations are not safely accessible using the L2350 (e.g. close tight spaces, on top roofs, etc).

Data Point

1. Locate the data points in each survey unit.
2. Mark each data point with tape or other non-permanent marking.
3. Document locations on the appropriate RSDS.

Static measurements

1. When using hand probes, the count time is 2 min for alpha measurements and 1 min for beta measurements.
2. Perform integrated counts at at any elevated locations identified by scanning.
3. Perform at least 20 biased location measurements in accessible locations. Seek assistance choosing biased sample locations from the project engineer or rad engineer.
4. At each static measurement location, take an alpha and beta measurement.
5. Record the location and document the results on the RSDS in accordance with Mound Rad Con procedures.
6. Document the gross activity for each location (no "<" or ">" values).

Continued next page

1 - 44/49

Specific Sampling and Survey Instructions Continued**Scanning using Ludlum 2350-1 with 43-68 (hand) probe**

1. Verify that the rate meters are set to alarm at or below 225 dpm/100 cm² alpha and 11250 dpm/100 cm² beta. (The RPOC or Rad Engineer will provide cpm values for alarm set points).
2. Scan at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
3. Perform a static measurement at every location where an indication of elevated activity is observed.
4. Record the locations and document the results of the area scanned on the RSDS.

Scanning using Ludlum 2360 with 43-89 probe

1. Scan in accordance with instrument procedures at a rate of ½ inch per sec at a distance of not more than ¼ " from the surface.
2. Perform a static measurement at every location where an indication of elevated activity is observed.
3. Record the locations and document the results of the area scanned on the RSDS.

Scanning the supply air systems

1. Ensure surfaces are clean and free of loose debris, dirt, and obstructions prior to performing survey.
2. Scan an area of approximately 1m² around each static measurement location.

Loose Surface Contamination

1. Obtain a smear of 100cm² at each static measurement location.
2. Count each smear for alpha, beta, and ³H.
3. Record location and results on the RSDS in accordance with Mound Rad Con procedures (no "<" or ">" values).

Quality Control

1. Check Configuration Index (CI) for latest revision of procedures.
2. Daily source checks will be performed at the beginning and end of each day in accordance with Mound Rad Con procedures.
3. 16 fixed measurement data points will be selected for resurvey from the pool of Class 2 areas. Data points selected for resurvey should include the highest and lowest measurement from the data pool.
4. 16 smears will be randomly selected for recount from the pool of Class 2 areas.
5. 5% of the scan measurements taken in Class 2 areas will randomly be selected for replicate scan surveys.

Continued next page

1-45/49

Specific Sampling and Survey Instructions Continued

- 6. Follow Rad Con procedures for Chain of Custody requirements.
- 7. Ensure alpha and beta smear results are obtained before performing ³H analysis.
- 8. Record location and results on the RSDS in accordance with Mound Rad Con procedures.

COMMENTS

All surveys shall be performed and documented in accordance with Mound Radiological Control procedures.

Perform fixed-point measurements surveys prior to collecting concrete sample.

Collect same amount of sample at each location. Ensure clean sample equipment is used for each distinct sample area/room.

Rad Con shall document all discrepancies from the above sampling and surveying instructions on the RSDS.

1 - 47/49

SPECIFIC SAMPLING / SURVEY INSTRUCTIONS

Safety Considerations

1. Obtain assistance from the responsible building custodian for assistance in collecting bulk sample.
2. Exercise extreme caution when collecting bulk samples.
3. Follow appropriate site safety procedures when accessing areas with potential electrical hazards.

Concrete Sample: Obtain one (1) bulk sample at each static and judgmental measurement location identified on the floor. (Applies to rooms 16, 61, 63, 48, 57, 58, and 59)

1. Composite and homogenize the samples from the drilled locations at a depth of 6" (15 cm) into one sample container per room. Composite and homogenize the samples from the area to be capped in 48 into a separate sample container. Composite and homogenize the samples from the area to be capped in Room 59 into a separate sample container.
2. Seek guidance from Radiological Engineer/RPOC with regard to type of sample container, sample mass at each location and total mass needed for each area/room composite sample.
3. Ensure each sample is labeled with date, time, room #, survey unit #, and sample ID#.
4. Record sample location on Radiological Survey Data Sheet.
5. Ensure chain of custody is maintained for all samples.
6. Process sample for gamma spectroscopy analysis in accordance with laboratory procedures.
7. Repeat process at a depth of approximately 12" (30 cm) at each of the previous locations using a smaller drill bit. Thoroughly clean the holes prior to second drilling.

Concrete Sample: Obtain one (1) bulk sample at each static and judgmental measurement location on the floor. (Applies to Room 277)

1. Composite the samples from the drill samples collected at a depth of approximately 5" (13 cm) into one sample container. Adjust the drill depth so that the bit penetrates as deep as possible without going through the floor.
2. Seek guidance from Radiological Engineer/RPOC with regard to type of sample container, sample mass at each location and total mass needed for each area/room composite sample.
3. Ensure each sample is labeled with date, time, room #, survey unit #, and sample ID#.
4. Record sample location on Radiological Survey Data Sheet.
5. Ensure chain of custody is maintained for all samples.
6. Process sample for gamma spectroscopy analysis in accordance with laboratory procedures.

General Area Exposure Rate Measurements

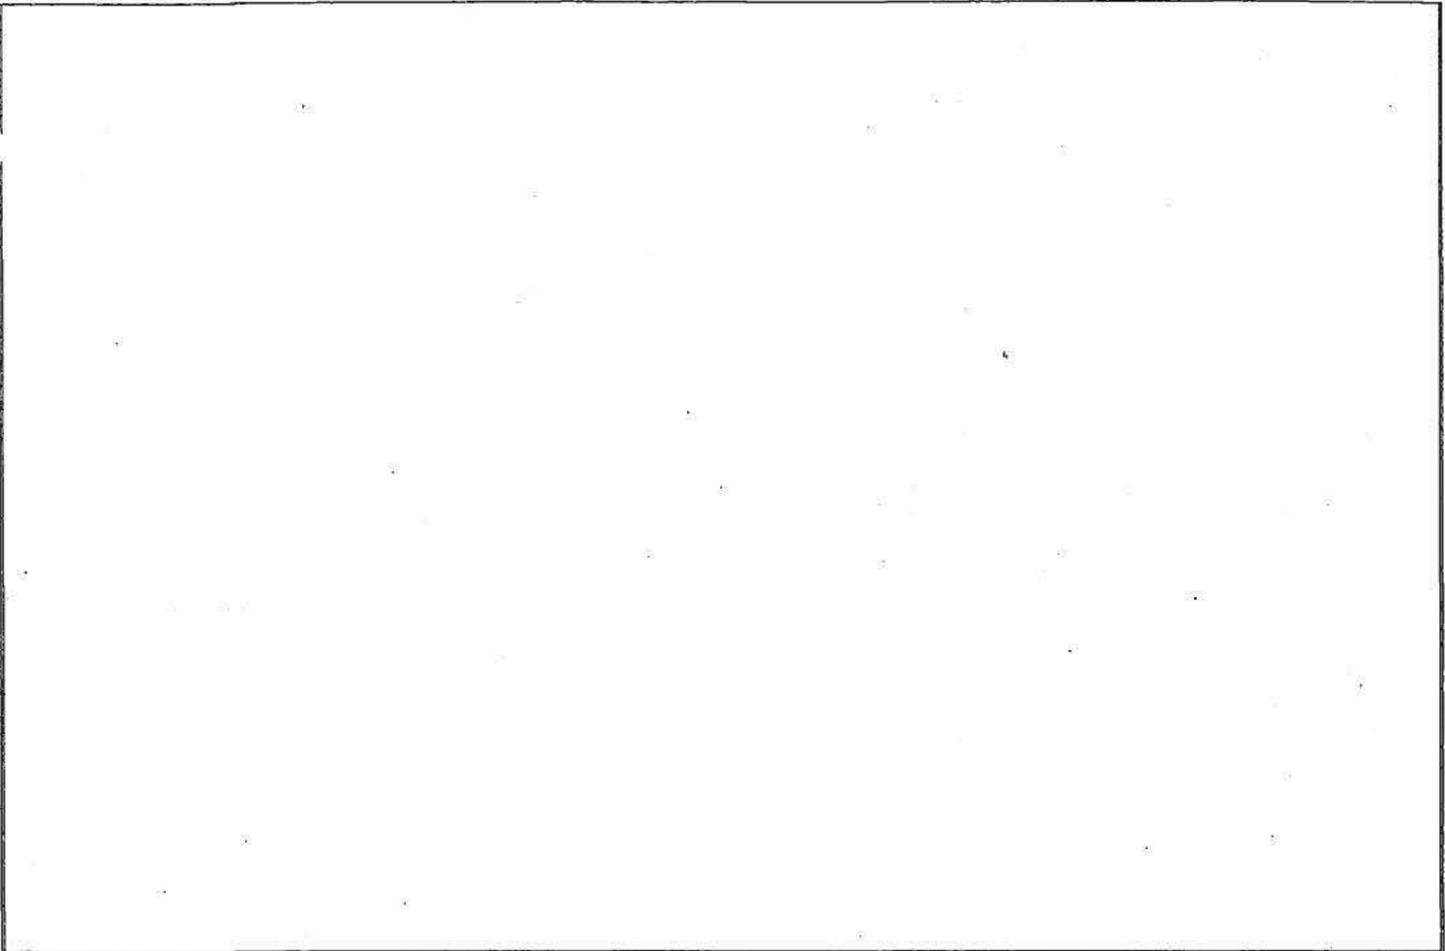

1. Perform general area exposure rate measurements at specified locations at 1 meter (m) from the surface.

Quality Control (QC) Measurements

1. Field duplicate taken in every 10 or fewer field samples
2. Replicate sample taken every 20 samples of a similar matrix

Reference Sample (obtain one bulk sample from an area that has not been impacted)

1 - 48/49

Project Manager	<i>V.P. [unclear]</i>	DATE	6-26-06

COMMENTS

NOTE: Rad Con shall document all discrepancies from the above sampling and surveying instructions on the Radiological Survey Data Sheet.

Ensure that the mass of sample collected from each location is consistent. Composite all sample from a given room to form a single bulk room sample for each room. After sample has been homogenized sample size may be reduced if necessary as need for the gamma spec lab.

NOTES:

1. See MD-80036 10002 for calculations of WB, extremity and skin dose rates.
2. To request RO Count Room analysis for β/γ, alpha or tritium, leave column blank. Mark column N/A if not needed. If count room printout of results are attached, write "see attached" in column.
3. Annotate special sample type (e.g., soil, water), special identifiers or otherwise in Comments. If not needed, mark N/A.

NOTES:

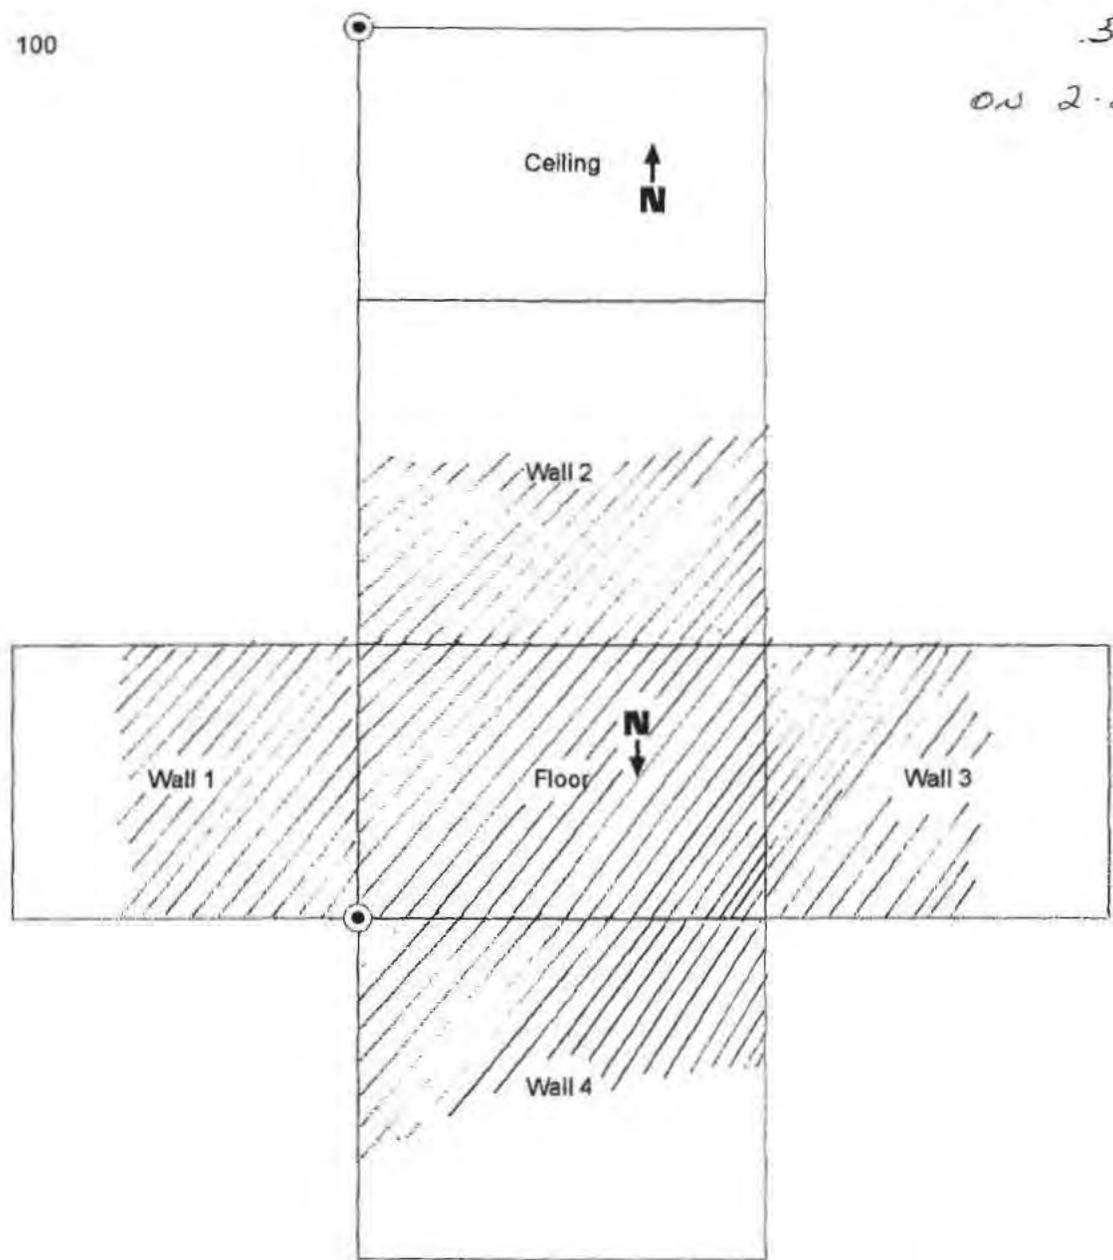

1. See MD-80036 10002 for calculations of WB, extremity and skin dose rates.
2. To request RO Count Room analysis for β/γ, alpha or tritium, leave column blank. Mark column N/A if not needed. If count room printout of results are attached, write "see attached" in column.
3. Annotate special sample type (e.g., soil, water), special identifiers or otherwise in Comments. If not needed, mark N/A.

NOTES:

1. See MD-80036 10002 for calculations of WB, extremity and skin dose rates.
2. To request RO Count Room analysis for β/γ , alpha or tritium, leave column blank. Mark column N/A if not needed. If count room printout of results are attached, write "see attached" in column.
3. Annotate special sample type (e.g., soil, water), special identifiers or otherwise in Comments. If not needed, mark N/A.

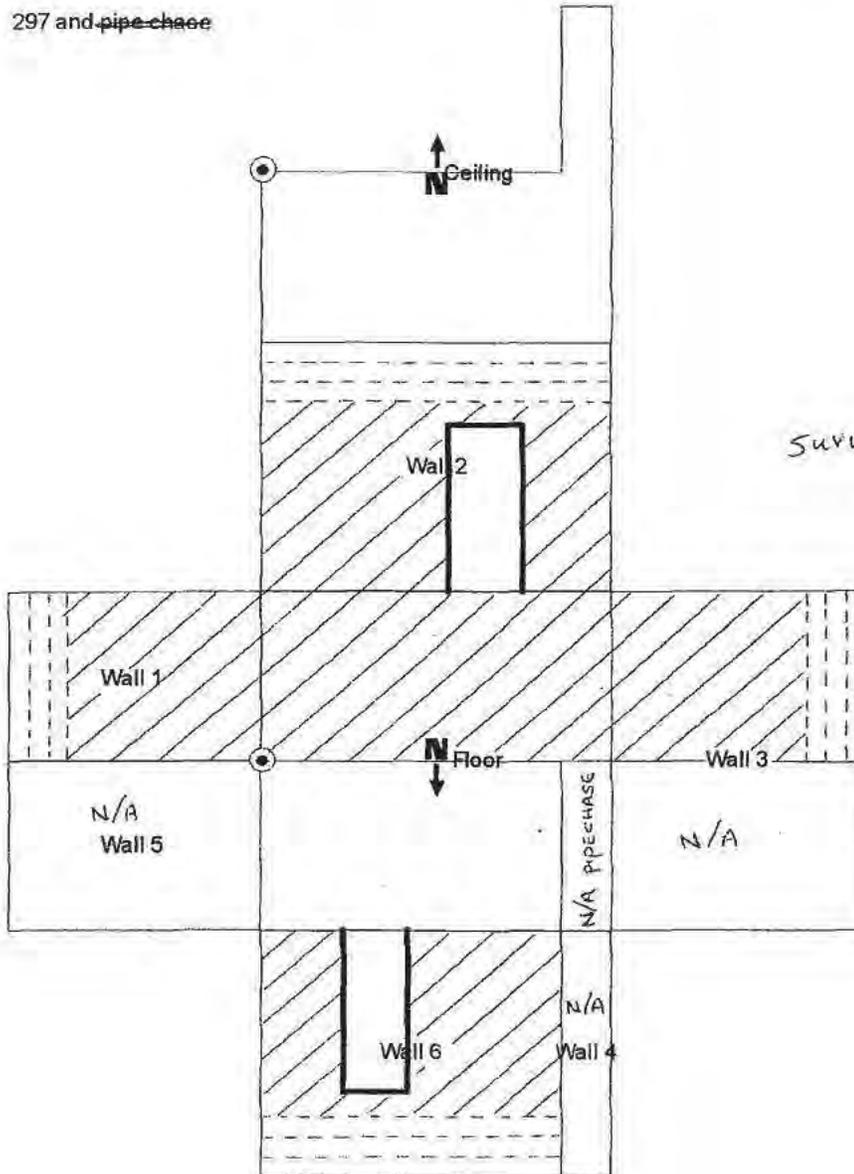

2N-01 100 % scan of floor
 Class 2 50% of walls up to 2 meters
 QA rescan 25% scan of walls above 2 meters

QC 3/13/06
~~Scan an area of approximately 1m2 around each static measurement on the ceiling~~ 3/13/06

NOTE: no static measurements were identified on the ceiling and
 pipe chase is not included only room 297

Pipe chase was reclassified as Class 1 and resurveyed as SU# 2N-15

297 and pipe chase

NOTES:

1. See MD-80036 10002 for calculations of WB, extremity and skin dose rates.
2. To request RO Count Room analysis for βγ, alpha or tritium, leave column blank. Mark column N/A if not needed. If count room printout of results are attached, write "see attached" in column.
3. Annotate special sample type (e.g., soil, water), special identifiers or otherwise in Comments. If not needed, mark N/A.

NOTES:

1. See MD-80036 10002 for calculations of WB, extremity and skin dose rates.
2. To request RO Count Room analysis for beta, alpha or tritium, leave column blank. Mark column N/A if not needed. If count room printout of results are attached, write "see attached" in column.
3. Annotate special sample type (e.g., soil, water), special identifiers or otherwise in Comments. If not needed, mark N/A.
