EXECUTIVE SUMMARY

A Reconnaissance Level Characterization (RLC) was performed to enable facility "Typing" per the RFETS Decommissioning Program Plan (DPP; K-H, 1999) and compliant disposition and waste management of certain 444 Cluster facilities (i.e., Buildings 444, 445, 447, 448, 450, 451 & 455). Because these facilities were anticipated to be Type 2 facilities, the characterization was performed in accordance with the Reconnaissance Level Characterization Plan (MAN-077-DDCP). All facility surfaces were characterized in this RLC, including the interior and exterior surfaces [i.e., floors (slabs), walls, ceilings and roofs]. Due to the areas being inaccessible at the time of the RLC, the elevator pits, Assembly Pit (Room 106 of B447) and inaccessible floor areas will be characterized during in-process characterization and/or the PDS. Environmental media beneath and surrounding the facilities were not within the scope of this RLCR and will be addressed at a future date using the Soil Disturbance Permit process and in compliance with RFCA

The RLC encompassed both radiological and chemical characterization to enable compliant disposition and waste management pursuant to the D&D Characterization Protocol (MAN-077-DDCP). The characterization built upon physical, chemical and radiological hazards identified in the facility-specific Historical Site Assessment Report.

Buildings 444, 445, 447 and 448 were used for the manufacturing, storage and packaging of depleted uranium metal and oxides, beryllium, and graphite stock and molds potentially contaminated with uranium and beryllium. Buildings 450, 451 and 455 are the three HEPA filter plenum structures that established and maintained negative pressure airflow on the 444 Cluster throughout manufacturing operations, and are still in operation to date.

Radiological surveys were performed to the more conservative transuranic DCGL limits. Radiological survey results indicated that radiological contamination in excess of the uranium DCGL_w is present in RLC Surveys Areas B, C, E, F, G, and K as expected. Radiological contamination exceeding the uranium DCGL_w is also present on and near loading docks of B444, B447, and B448 (Survey Units 444-B-009, 444-B-010, and 444-B-011). These areas of radiological contamination will be decontaminated and a PDS will be performed prior to building demolition. The exterior surfaces of Buildings 444, 445, 447, 448, 450, 451, and 455 were found to be within the transuranic DCGL limits with the exception of loading dock areas previously mentioned.

Buildings 444, 445, 447, 448, 450, 451, and 455 are on the RFETS list of known beryllium areas, and extensive data already existed that indicated beryllium contamination was present in these structures. Additional RLC data taken in data gap areas also confirmed the presents of beryllium in controlled and regulated beryllium areas.

A comprehensive, invasive asbestos inspection was conducted, which identified the presence of friable and non-friable asbestos containing building materials. Friable and non-friable asbestos containing building materials were identified in transite wall panels, drywall joint compound, paint on the cinderblock walls, black tar and silver paint roofing materials, linoleum, fire curtains, 9" x 9" vinyl floor tiles, 12" x 12" vinyl floor tiles, thermal systems insulation, exterior Transite wall panels, and ceiling tiles.

Some of the fluorescent light ballasts in the buildings contain PCBs. Prior to demolition, all ballasts will be checked and those containing PCBs will be removed and handled as TSCA regulated materials. Mercury containing switches are also present in the building and will be removed prior to demolition to be handled as RCRA regulated waste. PCB contamination was identified in approximately 100 square feet of the 444, Room 245, concrete slab and will be remediated prior to building demolition. All hazardous materials removed as part of the D&D effort will be managed according to (EPA) and Colorado Department of Public Health and Environment (CDPHE) regulations.

Based upon the data presented in this RLCR, the 444 Cluster anticipated Type 2 facilities are considered to be Type 2 facilities. The Type 2 classification is based on the relative complexity associated with decommissioning the facilities. Decontamination, dismantlement and demolition will be accomplished using industry standard techniques, and will not require unique or non-standard techniques. The radiological, chemical and physical hazards are not significant or overly intermingled and can be controlled through industry standard decontamination and decommissioning means.

6

1.0 INTRODUCTION

A Reconnaissance Level Characterization (RLC) was performed to enable facility "Typing" per the RFETS Decommissioning Program Plan (DPP; K-H, 1999) and compliant disposition and waste management of certain 444 Cluster facilities (i.e., Buildings 444, 445, 447, 448, 450, 451 & 455). Because these facilities were anticipated to be Type 2 facilities, the characterization was performed in accordance with the Reconnaissance Level Characterization Plan (MAN-077-DDCP). All facility surfaces were characterized in this RLC, including the interior and exterior surfaces of the facilities [i.e., floors (slabs), walls, ceilings and roofs], with the exception of the elevator pits, the Assembly Pit (Room 106 of B447) and inaccessible floor areas. The Assembly Pit is a confined space and was not accessible; these areas will be characterized during in-process characterization and/or the PDS. Environmental media beneath and surrounding the facilities were not within the scope of this RLC Report (RLCR) and will be addressed at a future date using the Soil Disturbance Permit process and in compliance with the Rocky Flats Cleanup Agreement (RFCA).

As part of the Rocky Flats Environmental Technology Site (RFETS) Closure Project, numerous facilities will be removed. Among these are the 444 Cluster anticipated Type 2 facilities. The locations of these facilities are shown in Attachment A, Facility Location Map. These facilities no longer support the RFETS mission and will be removed to reduce Site infrastructure, risks and/or operating costs.

Before the 444 Cluster anticipated Type 2 facilities can be decommissioned, a Reconnaissance Level Characterization (RLC) must be conducted; this document presents the RLC results. The RLC was conducted pursuant to the Decontamination and Decommissioning Characterization Protocol (MAN-077-DDCP) and the Reconnaissance Level Characterization Plan (RLCP) (MAN-077-DDCP). The RLC built upon physical, chemical and radiological hazards identified in the facility-specific Historical Site Assessment Report.

1.1 Purpose

The purpose of this report is to communicate and document the results of the RLC effort. RLCs are performed before building decommissioning to define the radiological, chemical and physical conditions of a facility. RLC conditions are compared with the release limits for radiological and non-radiological contaminants. RLC results will enable project personnel to make decommissioning decisions, develop related worker health and safety controls, estimate waste volumes by waste types, and maintain regulatory compliance.

1.2 Scope

This report presents the radiological and chemical conditions of the 444 Cluster anticipated Type 2 facilities. Due to the areas being inaccessible at the time of the RLC, the elevator pits, Assembly Pit (Room 106 of B447) and inaccessible floor areas will be characterized during in-process characterization and/or the PDS. Environmental media beneath and surrounding the facilities are not within the scope of this RLCR and will be addressed using the Soil Disturbance Permit process and in compliance with RFCA. Both facilities and environmental media will be dispositioned pursuant to RFCA.

1.3 Data Quality Objectives

The Data Quality Objectives (DQOs) used in designing this RLC were the same DQOs identified in the Reconnaissance Level Characterization Plan (RLCP) (MAN-077-DDCP). Refer to Appendix D, Section 2.0 of MAN-077-DDCP for these DQOs.

2.0 HISTORICAL SITE ASSESSMENT

Facility-specific Historical Site Assessments (HSAs) were conducted to understand facility histories and related hazards. The assessments consisted of facility walkdowns, interviews, and document review, including review of the Historical Release Report (refer to the D&D Characterization Protocol, MAN-077-DDCP). Results were used to identify data gaps and needs, and to develop radiological and chemical characterization packages. Results of the facility-specific HSAs were documented in a Historical Site Assessment Report (HSAR; refer to Attachment B). In summary, the HSAR identified the potential for radiological and chemical hazards, including the potential for uranium and beryllium contamination, asbestos containing materials, and PCBs in paint and light ballasts. The potential for transuranic contamination was not identified, but was analyzed for during the RLC process.

3.0 RADIOLOGICAL CHARACTERIZATION AND HAZARDS

The 444 Cluster anticipated Type 2 facilities were characterized for radiological hazards per the RLCP. Radiological characterization was performed to define the nature and extent of radioactive materials that may be present on the facility surfaces. Measurements were performed to evaluate the contaminants of concern. Based upon a review of historical and process knowledge, building walk-downs, and the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) guidance, a Radiological Characterization Plan was developed during the planning phase that describes the minimum survey requirements (refer to the RISS Characterization Project files for the Radiological Characterization Plan for the 444 Cluster Type 2 facilities). Radiological survey area packages were developed for each interior survey area in accordance with the RLCP (i.e., 12 interior survey areas: A - L), and radiological survey unit packages were developed for each exterior survey unit in accordance with the PDSP (i.e., 5 exterior survey units: 444-B-009 through 444-B-013). The B445 exterior was considered part of the B444 exterior, for RLC purposes. Individual radiological survey area/unit packages are maintained in the RISS Characterization Project files.

8

It is assumed that all facility systems are potentially contaminated and will be disposed of as low-level or low-level-mixed waste during facility decommissioning, and will not affect facility-typing determination. Therefore, only exterior surfaces of facility system piping, ducting, conduit, plenums, equipment, etc., were surveyed during the RLC.

Survey unit packages for the 444 Cluster anticipated Type 2 facilities were developed in accordance with Radiological Safety Practices (RSP) 16.01, *Radiological Survey/Sampling Package Design, Preparation, Control, Implementation and Closure*. Total surface activity (TSA), removable surface activity (RSA), and scan measurements were collected in accordance with RSP 16.02 *Radiological Surveys of Surfaces and Structures*. Radiological survey data were verified, validated and evaluated in accordance with RSP 16.04, *Radiological Survey/Sample Data Analysis*. Quality control measures were implemented relative to the survey process in accordance with RSP 16.05, *Radiological Survey/Sample Quality Control*. Radiological survey data, statistical analysis results, survey locations, and radiological scan maps are presented in Attachment C, Radiological Data Summary and Survey Maps.

A total of 1,171 TSA measurements and 1,171 RSA measurements were taken from building interior surfaces. A total of 346 TSA measurements and 346 RSA measurements were taken from building exterior surfaces, and 3% scan surveys were performed on the exterior surfaces.

In accordance with the PDSP, elevated fixed contamination levels were discovered during the scan survey of the B444 southeast wall and dock. Follow up investigation action included notification of Building Management and Characterization Team Management. Additional contamination surveys, and beta scan surveys were performed at each access portal (e.g., doors, docks, roll-up doors, etc.) throughout the B444 Cluster buildings. No removable contamination was detected, and the surveys were documented on separately from this report by B444 Radiological Operations personnel. Additional elevated fixed contamination above the uranium DCGLs was found on exterior dock areas of B447 and B448. All scanned areas with elevated beta count rates were marked on facility surfaces to indicate probable fixed contamination areas. Not all areas within the marked off areas are above the uranium DCGL_w (5,000 dpm/100cm²), however, they were marked as indicated on the B444, B447 and B448 maps to ensure that all contamination was bounded and easily identified for future remediation. Fixed contamination was also found on some driveway concrete and/or asphalt and is shown on the B444, B447, and B448 maps. All access portals within the B444 Cluster will be re-surveyed to PDS criteria prior to final demolition of the buildings. All other exterior facility surfaces meet the PDSP radiological release criteria.

No additional PDS radiological surveys are required except if a contamination event were to occur during decommissioning activities. Follow up action to a contamination event will require a verification survey prior to building demolition to ensure that PDSP release limits are met. Additionally, a confirmatory smear survey shall be performed of the exterior surfaces prior to demolition.

9

All depleted uranium stock had been removed from Buildings 444, 445, 447 and 448 prior to the RLC effort. The 444 Cluster is classified as a *Radiological Facility* based on the amount of depleted uranium present per the Facility Safety Analysis, Building 444 Cluster, dated May 2001. According to the Facility Safety Analysis, dated May 2001, there were approximately 64 metric tons of uranium metal, nine metric tons of uranium oxide, and 650 drums/crates of radiologically contaminated waste. Almost all of this material has been removed from the building and the only remaining material is residual depleted uranium contamination. Recent holdup measurement scan indicated that there is no Special Nuclear Material (SNM) in the building (Interoffice Memorandum from Frank Lamb, dated February 25, 2002, HMT-02.067), thus there is no transuranic or highly enriched uranium present. Materials Control & Accountability (MC&A) requirements have been terminated for all 444 Cluster buildings. However, most of the equipment and building systems, including filter plenums, are internally contaminated, or are assumed to be internally contaminated with depleted uranium.

To verify that no transuranics were present in the Building 444 Cluster, all 1,171 swipes from the interior surfaces (Areas A through L) were analyzed by the Canberra ISOCS system; no transuranic isotopes were detected. The only DOE added isotopes identified were uranium isotopes. Therefore, all interior portions of the 444 Cluster buildings are considered uranium only facilities; transuranic DCGLs do not apply. The analysis results are included in this report as Attachment C-18.

The following Table 3.1 summarizes RLC data from all 444 Cluster rooms and surfaces. Contamination in the B444 Cluster is present in floor areas, lower walls (<2 meters from floor), upper walls (>2 meters from floor), ceilings and equipment. Elevated readings were above the transuranic DCGLs on several exterior surfaces; these were investigated and found to be from uranium and other naturally occurring isotopes. The investigation data results can be found in Attachments C13– C18, Data Summaries for PDS Exterior Survey Units.

10

Table 3.1, Radiological Data Summary
 (X = Areas above the Uranium DCGLs, O = Areas below the Uranium DCGLs)

SURVEY AREA – DESCRIPTION	Floors and Lower Walls		Upper Walls and Ceilings		Equipment

444-B-009 ²	X	50,000	O	<100 ⁴	N/A	N/A
444-B-010 ²	X	18,000	O	<100 ⁴	N/A	N/A
444-B-011 ³	X	245.9 ⁴	O	<100 ⁴	N/A	N/A
444-B-012	O	174.3 ⁴	O	<100 ⁴	N/A	N/A
444-B-013	O	162.3 ⁴	O	<100 ⁴	N/A	N/A

- 1 - Systems and equipment are assumed to be internally contaminated
- 2 - Contamination on and around loading dock areas only
- 3 - Contamination on driveway only
- 4 - Maximum Total Alpha (dpm/100cm²)

Depleted uranium resides primarily in the plenums, ventilation filters, ducting and other production equipment. Most of the systems and equipment will be managed as surface contaminated objects. The removal of systems and equipment will be straightforward, conducted using industry standard, proven D&D methods that will prevent or minimize the release of radioactive material (refer to the RSOP for Component Removal, Size Reduction, and Decommissioning Activities). All radioactive material will be removed prior to the PDS using proven controls (e.g., fixatives and containments) to prevent release to the surrounding environment.

As a result of the information presented above, B444 Cluster anticipated Type 2 facilities (i.e., B444, B445, B447, B448, B450, B451, and B455) are confirmed to be Type 2 facilities from a radiological standpoint. Other factors supporting this typing include the following:

11

- B444 Cluster buildings did not processed bulk radioactive liquids and therefore has little contaminated piping, unlike the major plutonium facilities
- Systems and equipment can be disposed of using proven, straightforward D&D techniques
- Minimal size reduction is required of the systems and equipment
- Areas of contamination are known and are generally localized. The levels of radioactive contamination detected were expected, and relatively low compared to the applicable uranium DCGLs, and relatively low compared to plutonium facilities and their applicable transuranic DGGLs
- No transuranic or highly enriched uranium contamination was identified
- No contamination above the uranium DCGLs was found above 2 meters
- All facility surfaces can be easily decontaminated using proven, straightforward, industry standard decontamination techniques

4.0 CHEMICAL CHARACTERIZATION AND HAZARDS

The 444 Cluster anticipated Type 2 facilities were characterized for chemical hazards per the RLCP. Chemical characterization was performed to determine the nature and extent of chemical contamination that may be present on or in these facilities. Based upon a review of historical and process knowledge, visual inspections, and RLCP DQOs, additional sampling needs were determined. A Chemical Characterization Plan (refer to RISS Characterization Project files for the Chemical Characterization Plan for the 444 Cluster Type 2 facilities) was developed during the planning phase that describes sampling requirements and the justification for the sample locations and estimated sample numbers. Contaminants of concern included asbestos, beryllium, RCRA/CERCLA constituents, and PCBs. A summary of each chemical concentration of concern is described in the following sections.

4.1 Asbestos

A survey of building materials suspected of containing asbestos was conducted in the aforementioned buildings in accordance with the RLCP. A CDPHE-certified asbestos inspector conducted the inspection and sampling in accordance with the *Asbestos Characterization Protocol, PRO-563-ACPR, Revision 1*. Building materials suspected of containing asbestos were identified for sampling at the discretion of the inspector.

A comprehensive, invasive inspection was conducted in Buildings 444, 445, 447, and 448 to determine the presence of friable and non-friable asbestos containing building materials. The following asbestos containing materials were identified:

12

444 Cluster Asbestos Summary Table

Building	Material	Friable or Non-Friable	Approximate Quantities
444	Transite Wall Panel	Category 2 Non-friable	72,577 square feet
444	Drywall Joint Compound	Category 1 Non-Friable	5,200 square feet
444	Paint on Concrete Mortar Unit (CMU) walls	Category 1 Non-Friable	32,199 square feet
444	Black Tar and Silver Paint on Roof	Category 1 Non-Friable	136,000 square feet
444	Linoleum	Friable	800 square feet
444	Silver Fire Curtain	Friable	64 square feet
444	9" x 9" vinyl floor tiles	Category 1 Non-Friable	40,500 square feet
444	12" x 12" vinyl floor tiles	Category 1 Non-Friable	17,822 square feet
444	2' x 4' acoustical drop ceiling tiles	Friable	31,126 square feet
444	Thermal Systems Insulation	Friable	14,489 lineal feet
445	Thermal Systems Insulation	Friable	250 lineal feet of pipe insulation < 6"OD (fittings included)
447	Thermal Systems Insulation	Friable	5,471 lineal feet
447	Exterior Transite Wall Panels	Category 2 Non-Friable	18,238 square feet
447	Transite Wall Panels	Category 2 Non-Friable	6,210 square feet
447	9" x 9" vinyl floor tile	Category 1 Non-Friable	4,620 square feet
448	Thermal Systems Insulation	Friable	100 lineal feet of pipe insulation < 6" OD (fittings included)

B

The filter plenum buildings (450, 451, and 455) are internally contaminated with uranium and beryllium. Since 450, 451, and 455 are part of the internal contaminated filtering system, they were not accessed in order to determine asbestos containing building materials. Any building material in these three structures that could contain asbestos is assumed to be asbestos containing or until further in-process characterization is performed.

Asbestos laboratory analysis data and location maps are contained in Attachment D, "Chemical Data Summaries and Sample Maps." Maps that did not contain any sample locations were not included in this report.

4.2 Beryllium (Be)

Buildings 444, 445, 447 and 448 were beryllium manufacturing and machining facilities that have been in operation since 1953. Based on the HSAR, Interview Checklists, and beryllium sampling data in the RFETS Industrial Hygiene Information System (IHIS), there was adequate historical and process knowledge to conclude that beryllium was present in these buildings. Sampling data indicate beryllium contamination on interior facility surfaces and equipment. Building systems, filter plenums, and some equipment are also internally contaminated. Beryllium laboratory smear results collected and entered into the IHIS from January 1999 through August 2002 are summarized in Attachment D-1. Attachment D-1 details the range of beryllium contamination by building and room. Sub-totals of smear results per building are also included. In addition, other historical data, not included in the IHIS, may be found in the following Baseline Beryllium Survey reports:

- Baseline Smear Surveys for Beryllium in Buildings 444, 447 and 448, Aug. 9, 1993
- Baseline Beryllium Survey, Building 444, Sept. 11, 1995
- Baseline Beryllium Survey, Building 447, Sept. 11, 1995

The above reports support and corroborate the beryllium data summarized in this RLCR.

To supplement the extensive historical, beryllium IHIS data, a "worst case" beryllium sampling plan was developed per the RLCP. Since the pits, trenches, drains, basins, and sumps in Building 444 have not undergone any cleaning operations, it was logical to conclude that the highest levels of beryllium contamination would be in these low-lying areas where beryllium sludge and dust would accumulate. Forty-nine beryllium smears were taken in these low-lying locations. Four (4) were above the investigative level of $0.1 \mu\text{g}/100\text{cm}^2$, and six (6) exceeded the unrestricted release limit of $0.2 \mu\text{g}/100\text{cm}^2$ with a maximum level of $2.86 \mu\text{g}/100\text{cm}^2$ (refer to Attachment D-3).

This level of contamination can be effectively managed during routine decontamination operations. Moreover, it has been demonstrated by plant personnel and outside contractors (for example, decontamination and decommissioning efforts in Buildings 865 and 707) that the elimination of beryllium dust as a threat to personnel and the environment is achievable. Additionally, stabilization and hazard reduction activities have been ongoing in the 444 Cluster for the past several years with minimal incidences or spread of beryllium contamination. The beryllium contamination that remains can be managed, controlled, and effectively disposed of using proven, straightforward, industry standard decontamination techniques.

14

A high percentage of the beryllium contamination in the 444 Cluster was found on manufacturing and milling equipment. As this beryllium-contaminated equipment is decontaminated and removed from the buildings, using proven, straightforward techniques, the beryllium hazard will be significantly reduced. This beryllium hazard reduction will continue throughout the decontamination and decommissioning process. Beryllium contamination levels found on facility surfaces were generally much lower than the levels found on equipment. In fact, the highest level of beryllium contamination found on non-equipment surfaces was on the floor in Room 31 of Building 447 at 17.90 $\mu\text{g}/100\text{cm}^2$. This level of beryllium contamination can be readily decontaminated within the scope of conventional decommissioning procedures. Thus, once the contaminated equipment is removed, the facility surfaces will be relatively easy to decontaminated using proven effective techniques.

4.3 RCRA/CERCLA Constituents [including metals, semi-volatile (SVOC), and volatile organic compounds (VOCs)]

Based on the HSAR, only Buildings 444 and 447 of this group have a history of storage and use of RCRA/CERCLA hazardous substances. Floor stains from historical operations in B444 were observed during facility walkdowns. Therefore, some RLC sampling was conducted in affected 444 Cluster locations. The areas identified as those needing sampling were selected based on historical knowledge and visual evidence of contamination, such as stains. Some stained areas were excluded from sampling based on analytical data obtained from oil drained from the machines responsible for the stains. Historical information, such as the Idle Equipment List, was consulted prior to excluding an area from sampling based on the most recent oil samples. The areas selected for sampling are detailed on the sample maps located in Attachment D-4. The Idle Equipment List and data from the oil samples are available for review, and is located in the RISS 444 Cluster Characterization Files.

Sample results from both the RLC sampling and the recent oil sampling efforts indicated that, although past processes have involved RCRA/CERCLA substances, the building has not suffered contamination resulting in the need to assign a RCRA waste code. Characteristic wastes were all well below RCRA limits. SVOC and VOC results were all in the parts per billion range, and were all for substances that do not qualify for a listed code based on knowledge of building history. EPA has stated that if a material cannot be determined to be a listed waste through a good faith review of process knowledge and documentation, the material does not qualify as a listed waste and, provided it does not exhibit a characteristic, the material is not RCRA regulated. Sample results and sample location maps are presented in Attachment D-4.

Some areas may have a potential for RCRA/CERCLA chemical contamination but were inaccessible at the time the RLC was conducted (i.e., the B444 and B447 elevator pits, and the chip roaster area in B447). Inaccessibility was due to the HCA postings or safety concerns with working in the elevator pits. These areas will be characterized for RCRA/CERCLA constituents during in-process characterization, once they become available.

Based on the HSAR and interviews, Buildings 445, 448, 450, 451 and 455 did not have a history that would lead to RCRA/CERCLA contamination, and a visual inspection did not indicate any areas of concern. No process activities resulting in a release of RCRA waste or CERCLA hazardous substances occurred in these buildings, therefore, sampling was not conducted.

The 444 Cluster anticipated Type 2 facilities may contain some RCRA-regulated items, such as mercury thermostats, fluorescent light bulbs, mercury vapor light bulbs, mercury containing gauges, circuit boards, leaded glass and lead-acid batteries. These items will be removed prior to demolition and managed in accordance with the Colorado Hazardous Waste Act.

Sampling for lead in paint in the 444 Cluster anticipated Type 2 facilities was not performed. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based paint Debris Disposal*, states that LBP debris generated outside of currently identified high contamination areas (HCA's) shall be managed as non-hazardous (solid) wastes, and additional analysis for characteristics of hazardous waste derived from LBP is not a requirement for disposal. Painted materials in HCA's will need to either be sampled prior to demolition, or assumed to contain lead-based paint, and assigned the RCRA code D008.

4.4 Polychlorinated Biphenyls (PCBs)

Based on the HSAR, interviews and facility walkdowns, some spills involving PCBs could have occurred in B444, therefore, sampling was conducted in potentially affected areas. The areas identified as those needing sampling were selected based on historical knowledge and visual evidence of contamination, such as floor stains. Some stained areas were excluded from sampling based on analytical data obtained from oil drained from the machines responsible for the stains. Historical information, such as the Idle Equipment List, was consulted prior to excluding an area from sampling based on the most recent oil samples. The Idle Equipment List and data from the oil samples are available for review, and is located in the RISS 444 Cluster Characterization Files.

Sample results from RLC core samples indicated that two adjacent samples in B444, Room 245, have PCB contamination above the 50 ppm regulatory limit. The area affected is approximately 100 square feet. Remediation alternatives will be evaluated and selected by building D&D personnel. This area will be managed during in-process D&D to ensure that the area is dispositioned properly. Refer to Attachment D-5 for sample locations and results.

16

Some areas may have a potential for PCB contamination, but were inaccessible at the time this RLC was conducted (i.e., the B444 and B447 elevator pits, and the chip roaster area in B447). These areas will be characterized for PCBs during in-process characterization, once they become accessible.

Based on the HSAR, interviews and facility walkdowns, Buildings 445, 448, 450, 451 and 455 do not have any potential for PCB contamination. No process activities resulting in a release of PCBs occurred in these buildings. Therefore, sampling was not conducted.

Based on the age of the 444 Cluster anticipated Type 2 facilities (constructed prior to 1980, except for Building 451), paints used may contain PCBs, and painted surfaces will need to be disposed of as PCB Bulk Product Waste. Painted concrete surfaces can be used as backfill onsite (based on PCB content only) in accordance with approval received from EPA in November 2001 (letter from K. Clough, US EPA Region 8, to J. Legare, DOE RFFO, 8EPR-F, Approval of the Risk-Based Approach for Polychlorinated Biphenyls (PCB)-Based Painted Concrete), provided the concrete meets the unrestricted-release criteria outlined in the Concrete Recycling RSOP.

Some facilities may contain fluorescent light ballasts that may contain PCBs. Therefore, fluorescent light fixtures will be inspected to identify PCB ballasts during removal operations. PCB ballasts will be identified based on factors such as labeling (e.g., PCB-containing and non-PCB-containing), manufacturer, and date of manufacturing. All ballasts that do not indicate non-PCB-containing are assumed to be PCB-containing.

Based upon the chemical hazards identified above (i.e., asbestos, beryllium, RCRA/CERCLA constituents and PCBs), Buildings 444, 445, 447, 448, 450, 451, and 455 are confirmed to be Type 2 facilities from a chemical standpoint. All asbestos, beryllium and PCB contamination can be managed using proven straightforward remediation techniques. Refer to Attachments D, Chemical Summary Data and Sample Maps, for details on sample results and sample locations.

5.0 PHYSICAL HAZARDS

Physical hazards associated with the 444 Cluster anticipated Type 2 facilities consist of those common to standard industrial environments, and include hazards associated with energized systems, pressurized systems, compressed and flammable gases, forklifts, elevated surfaces, and trips and falls. For example, there are in-floor waste sumps and pits in B444, as well as elevator pits in B444 and B447. Also, gaseous hydrogen is generated by wet-cell battery charging operations in B444 and B445. There are no unique hazards associated with the facilities that cannot be managed using proven, straightforward D&D techniques.

There are eight large vertical vacuum casting furnaces located in Rooms 10, 109 and 201 that used carbon molds for metal castings. These furnaces will be dispositioned using conventional D&D techniques such as the application of fixatives and/or foaming, partial disassembly via unbolting pieces, and plastic wrapping. These furnaces may be removed from the building through a roof opening such as what was done for the Building 886 HEUN tanks in Room 103, or may be protected and left in place during demolition and later removed as SCO waste. There is other large equipment such as the Heald Model S Bore-Matic in Room 101E, the Steiger welding machine in Room T101H, the Lindberg furnace in Room 125, the Retech Arc Furnace in Room 405B, and the three vacuum furnaces in Room 403, that can also be dispositioned used conventional D&D techniques.

All areas of the facilities (e.g., ventilation chases, air tunnels, pits, etc.) are accessible and will not require the use of robotic equipment to complete D&D. The facilities have been well maintained and are in good physical condition, and therefore, do not present hazards associated with building deterioration. Physical hazards are controlled by the Site Occupational Safety and Industrial Hygiene Program, which is based on OSHA regulations, DOE orders, and standard industry practices. Based on this physical hazards assessment, the physical hazards of the 444 Cluster buildings confirm a Type 2 classification.

6.0 DATA QUALITY ASSESSMENT

Data used in making management decisions for decommissioning of the 444 Cluster anticipated Type 2 facilities, and consequent waste management, are of adequate quality to support the decisions documented in this report. The data presented in this report (Attachments C and D) were verified and validated relative to DOE quality requirements, applicable EPA guidance, and original DQOs of the project.

In summary, the Verification and Validation (V&V) process corroborates that the following elements of the characterization process are adequate:

- ◆ the *number* of samples and surveys;
- ◆ the *types* of samples and surveys;
- ◆ the sampling/survey process as implemented “in the field”; and,
- ◆ the laboratory analytical process, relative to accuracy and precision considerations.

Details of the DQA are provided in Attachment E.

7.0 DECOMMISSIONING WASTE TYPES AND VOLUME ESTIMATES

The disposition of the subject 444 Cluster facilities will generate a variety of wastes, including radiological, asbestos, beryllium, hazardous and PCB wastes. Estimated waste types and waste volumes are presented below by facility. Asbestos containing material, PCB Bulk Product Waste, including PCB ballasts, and hazardous-waste items will be managed pursuant to Site asbestos abatement and waste management procedures.

Waste Volume Estimates and Material Types, 444 Cluster Anticipated Type 2 Facilities							
Facility	Concrete (cu ft)	Wood (cu ft)	Metal (cu ft)	Corrugated Sheet Metal (cu ft)	Wall Board (cu ft)	ACM* (cu ft)	Other Waste (cu ft)
Building 444	210,000	0	10,500	0	9,700	16,925	10,300 - Built-up roofing
Building 445	9,500	0	21,200	4,000	1,200	135	4,000 - insulation
Building 447	50,500	0	3,800	0	1,400	1,823	3,600 - Built-up roofing
Building 448	1,500	0	700	0	0	35	0
Building 450	4000	0	5,000	0	0	0**	0
Building 451	2800	0	3,800	0	0	0**	0
Building 455	400	0	600	0	0	0**	0

*Refer to the Asbestos Summary table in Section 3.2 for additional asbestos quantity breakdowns.

**Any building material that could contain asbestos is assumed to contain asbestos or until further in-process characterization is performed.

8.0 FACILITY CLASSIFICATION AND CONCLUSIONS

Based on the analysis of radiological, chemical and physical hazards, the 444 Cluster anticipated Type 2 facilities (i.e., Buildings 444, 445, 447, 448, 450, 451 & 455) are classified as RFCA Type 2 facilities pursuant to the RFETS Decommissioning Program Plan (DPP; K-H, 1999). The Type 2 classification is based on a review of historical and process knowledge, and existing and newly acquired RLC data, and the relative complexity associated with decommissioning the facilities. Decontamination, dismantlement and demolition will be accomplished using industry standard techniques, and will not require unique or non-standard techniques. The radiological, chemical and physical hazards are not significant or overly intermingled and the hazards can be controlled through standard, conventional means.

Buildings 444, 445, 447, and 448, while listed as individual structures, were in fact a single, functioning depleted uranium and beryllium manufacturing facility from 1953 until 1994. Buildings 445, 447, and 448 were additions to 444 in order to support and assist in the casting, fabrication, milling, and assembly of weapons components. The three HEPA filter plenum structures (450, 451, and 455) established, and maintained, negative pressure airflow on the 444 Cluster throughout manufacturing operations, and continue to operate to date. The source cause of uranium and beryllium contamination was removed in 1994 when manufacturing ended.

Filtered, negative air pressure has continued unabated in the 444 Cluster. In 1994, decontamination and clean-up operations began. Since then numerous pieces of depleted uranium and beryllium contaminated equipment and machinery have been disassembled, containerized, and disposed of with minimal uncontrolled releases to personnel or the environment. Fixatives have been applied to surfaces and have proven effective in locking down fugitive uranium and beryllium dust.

While depleted uranium and beryllium contamination remains in the 444 Cluster, successful clean-up operations have been in effect since 1994. Moreover, it has been demonstrated by plant personnel and outside contractors (for example, decontamination and decommissioning efforts in Buildings 865 and 707) that the elimination of beryllium dust as a threat to personnel and the environment is achievable. The uranium and beryllium contamination that remains can be managed, controlled, and effectively disposed of during demolition of the 444 Cluster.

The Radiological RLC Survey of areas A through L confirmed depleted uranium contamination as expected for this Type 2 facility. The PDS surveys of exterior surfaces found contamination levels above the uranium DCGLs on and around loading docks. Future PDS surveys will be performed in and around the loading dock areas and building interiors after decontamination efforts are complete. All other exterior facility surfaces meet the PDSP radiological release criteria. No additional PDS radiological surveys are required except if a contamination event were to occur during decommissioning activities. Follow up action to a contamination event will require a verification survey prior to building demolition to ensure that PDSP release limits are met. Additionally, a confirmation smear survey shall be performed of the exterior surfaces prior to demolition.

Areas that were inaccessible during this RLC will be characterized during in-process and/or PDS characterization. Demolition of these facilities will generate radiological, beryllium, hazardous, PCB and asbestos wastes. All wastes will be disposed of in compliance with EPA, DOE, and CDPHE regulations. Environmental media beneath and surrounding the facilities will be addressed at a future date using the Soil Disturbance Permit process and in compliance with RFCA.

The RLC of the 444 Cluster Type 2 facilities (interior surfaces) was performed in accordance with the DDCP and RLCP, all RLCP DQOs were met, and all data satisfied the RLCP DQA criteria. The PDS of the 444 Cluster Type 2 facility exterior surfaces was performed in accordance with the DDCP and PDSP, all PDSP DQOs were met, and all data satisfied the PDSP DQA criteria, except as noted above. In summary, the 444 Cluster facilities (i.e., Buildings 444, 445, 447, 448, 450, 451 & 455) are confirmed to be a Type 2 classification.

Historical Site Assessment Reports

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Facility ID: Buildings 444, 447, 448, 450, 451, and 455.

Anticipated Facility Type (1, 2, or 3): Buildings 444, 447, 448, 450, 451, and 455 are anticipated Type 2 facilities.

This facility-specific Historical Site Assessment (HSA) has been performed in accordance with:

D&D Characterization Protocol, RFETS MAN-077-DDCP, latest version, and

Facility Disposition Program Manual, RFETS MAN-076-FDPM, latest version

Physical Description

Building 444

Building 444 has a total floor area of 162,000-sq. ft, with 112,900-sq. ft. on the ground floor, 23,700-sq. ft. in the basement and 25,400-sq. ft. in the mezzanine. The building is a reinforced concrete structure. The exterior walls are reinforced concrete between reinforced concrete beams. The roof is a pre-cast concrete panel with built-up insulation. The floor is a poured in place concrete slab. In 1955, radiographic vaults and dimensional metallurgical laboratory were added to the northwest corner of the building. The 1955 addition was constructed of re-enforced concrete walls with a steel frame support structure and a corrugated metal roof with built-up roofing. Other smaller minor additions were added around the 444 structure to enclose dock areas, and breezeways. The exact dates of these minor additions are not documented, but were primarily built on existing concrete slabs and were constructed of corrugated metal on steel frames and were usually built prior to 1985.

Building 447, 448 and 445 are labeled as separate structures but are frequently referred to as additions to Building 444. Building 447 was constructed on the south side of the structure in 1956. Building 445 was added to the east side of the structure in 1957, and Building 448 was added to the north side of Building 447 in 1962.

South of Building 444 is a small freestanding beryllium filter plenum and chip cyclone separator. This plenum has no building number, but was originally constructed in the basement of Building 444 in 1974 and was moved outside to its current location in 1986. This beryllium filter plenum provided ventilation to the Building 444 beryllium shop. The beryllium plenum is a steel frame structure built on a concrete slab. The walls and roof are constructed of steel plate, with several marine-type airtight access doors. The chip cyclone next to the filter plenum is constructed of sheet steel and steel support members.

Building 444 is serviced by the following utilities; water, sanitary, electric, process waste, and steam heat. Fire protection is provided by an overhead sprinkler system and wall-mounted fire extinguishers.

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Building 447

Building 447 has 23,100-sq. ft. of floor space and was used to expand the Building 444 beryllium and uranium manufacturing operations. Building 447 is a steel-framed structure built in 1956 on a concrete slab with a partial basement. The exterior walls are corrugated asbestos-cement board, corrugated metal and concrete masonry blocks. The interior walls are primarily concrete masonry blocks. In the early 1980s an addition was constructed on the south side of Building 447 to a new ark melt furnace. This furnace was never used. The addition was approximately 800-sq. ft. and was constructed of corrugated steel and asbestos board attached to a steel frame built on a concrete slab. The original Building 447 ventilation system was exhausted through stacks on the west side of Building 444. These stacks were removed in 1983 with the addition of the Building 451 filter plenum.

Building 447 is serviced by the following utilities; water, sanitary sewer (locked-and tagged out), natural gas (locked-and tagged out) electric, process waste, and steam heat. Fire protection is provided by an overhead sprinkler system and wall-mounted fire extinguishers.

Building 448

Building 448 is a single-story 4000 sq. ft. structure added to the north side of Building 447. Building 448 was constructed in 1961 and was used to ship and store beryllium and uranium parts. Building 448 is steel framed structure build on a concrete slab. The exterior walls and roof are insulated corrugated sheet metal. In 1969, Room 602 was added to the Building 448 and was constructed of the same material as the original Building 448 construction.

Building 448 is serviced by the following utilities; water, electric, and steam heat. Fire protection is provided by an overhead sprinkler system and wall-mounted fire extinguishers.

Building 450

Building 450 is a 4050 sq. ft. two stage HEPA filter plenum located south of Building 444. The filter plenum was constructed in 1958 and provides primary ventilation for most of Building 444. Building 450 is a single-story steel-framed building constructed on a concrete slab. The wall and roof are constructed of corrugated steel with several marine-type airtight access doors.

Building 450 is serviced by the following utilities; fire water, electric, fire suppression is provided by overhead water sprinkler system.

Building 451

Building 451 is a 2,780 sq. ft. two-stage HEPA filter plenum located south of Building 447. The filter plenum was constructed in 1983 and provides ventilation to Buildings 447 and 448. Building 451 is a single-story steel-framed building constructed on a concrete slab. The wall and roof are constructed of corrugated steel, with several marine-type airtight access doors.

Building 451 is serviced by the following utilities; water, electric, fire suppression is provided by over headwater sprinkler system.

26

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Building 455

Building 455 is a 1,800sq. ft. two-stage HEPA filter plenum (and re-circulating fan) located east of Building 444. The filter plenum was constructed in 1974 and provides ventilation to the production plating operation in the Building 444 mezzanine. Building 455 is single-story steel framed building constructed on a concrete slab. The wall and roof are constructed of steel plate, with several marine-type airtight access doors. Building 455 is currently out of service.

Building 455 is serviced by the following utilities; water, electric, fire suppression is provided by over head water sprinkler system.

Historical Operations

Building 444

Building 444 is the Depleted Uranium and Beryllium Manufacturing Facility and operated from 1953 until 1994, when the majority of the processes ceased operations. During its history a variety of manufacturing operations and special project occurred in Building 444 and its support structures. These processes include the following;

Casting - Casting operations took place in the foundry in Building 444 mezzanine, Rooms 201 and 205, and in Rooms 109 and 117A on the main floor. The foundry cast ingots were made of depleted uranium, beryllium, and to a less extent silver aluminum and copper.

Fabrication - Fabrication operations in Building 444 included machining of beryllium and depleted uranium. Machining operations included lathes, turning and milling machines, electrical-discharge machining, and chemical-machining equipment. A negative air pressure was maintained in fabrication areas to prevent the spread of contaminated dust into other areas.

Beryllium machining was conducted in Rooms 106, 106A, 106B, 107. Machining operations included sawing, milling, drilling and lathe operations. If needed, the pieces were then polished and abraded. Chemical milling of fabricated beryllium parts occurred in Room 203.

Machining of depleted uranium was conducted in Room 101. Metal parts containing depleted uranium, depleted uranium alloy, and depleted uranium with traces of iron, silica, titanium, aluminum, or stainless steel were cut in the depleted uranium machining process. Machining operations included turning, boring, milling, and sawing. Ingots and semi-finished and finished depleted uranium parts was heat treated in the induction furnace located in Room 403 of Building 447. Several uranium fires occurred in the uranium machining area throughout the building history. These fire were usually small with smoke and fumes captured by the building's ventilation system and no releases to the environment.

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Assembly – The assembly process involved the welding or brazing of stainless steel, depleted uranium, and beryllium parts. The assembly process first involved cleaning, which was performed prior to welding or brazing. The cleaning process normally used PCE, alcohol, Freon or some other solvent to clean the parts. After the individual parts were cleaned they were welded or brazed to make the components.

Testing and Inspecting - Assembled parts were then tested and inspected. Assemblies testing included leak testing, pressure testing, weight determination, swaging and electromarking. In addition, a variety of NDA testing was conducted. NDA testing included radiography, dye penetrate testing, weight and density testing, and beta back scattering. Product Inspection verifying part dimensions and conformance to specifications. These activities were primarily performed in Rooms 101A through 101F.

Coating and Plating - Coating and plating operations were performed on non-nuclear parts manufactured in Building 460. In preparation for coating, the parts were grit-blasted, ultrasonically cleaned, rinsed, and dried. The parts were then coated with erbium nitrate, dried, and heat-treated. The heat-treating decomposed the erbium nitrate to erbium oxide. Residual spray was removed using a silicon grit blast. Plating and etching operation involved acid etching the parts prior to plating with a variety of plating solutions which include silver, nickel, gold, and a acid etching bath. Chemical used in the plating process include but are not limited to ammonium hydroxide, hydrochloric acid, nitric acid, hydrogen peroxide, toluene, nickel chloride. These activities predominantly occurred in Rooms 137, 212, and 247.

Special projects - Other known special projects conducted in Building 444 included cadmium rolling and forming, research and development operations; beryllium research and development work using tetrabromoethylene for float/sink tests and machining of lithium salts.

Tool manufacturing – Building 444 manufactured a variety of special order tools for the site. This non-radiological tool manufacturing operations included tool engineering, tool grinding, tool/gauge fabrication (precision shop), tool and gauge inspection, development and application of plating techniques and materials, and graphite mold fabrication.

Laboratories – Building 444 housed a variety of laboratories which supported the depleted uranium and beryllium manufacturing operations. The laboratory activities included the dimensional metallurgical laboratory (DML) in Room 181, the plating laboratory Rooms 245, 212A and 212, and the beryllium counting laboratory in Room 14. Several inspection laboratories were in located in Rooms 101A through 101F. These laboratories were primarily used to measure and evaluate specification tolerances on machined parts.

See section below on “Environmental Restoration Concerns” for a listing of IHSSs, PACs, and UBCs associated with Building 444.

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Building 447

Building 447 is the Depleted Uranium Manufacturing Building and was constructed in 1956. This building was used to manufacture and assemble weapon components. These activities include cleaning of parts, assemble inspection, welding, and heat treating. Materials handled included stainless steel, beryllium, aluminum, depleted uranium, and vanadium components. Metal parts machined in Building 444 and 460 are cleaned, leak tested, heat treated, and assembled in Building 447.

Major manufacturing and assemble activities included electron beam welding in Room 406, electrochemical milling in Room 407, heat treating in Room 403, and parts and assemble cleaning operation in Rooms 406, 406A, and 409. Acetone and other solvents were used in the cleaning process. NDA testing in room 407.

In 1956, the chip roaster in Rooms 32 and 502 became operational. Depleted uranium chips recovered from machining areas in Building 444 were collected in 55-gallon drums, transferred to Building 447, and burned to an oxide (a more stable form) under controlled conditions in the chip roaster. The oxides were packaged and shipped off-site for disposal. Other waste management activities included depleted uranium waste chip cementation in Room 501 and low level waste packaging.

See section below on "Environmental Restoration Concerns" for a listing of IHSSs, PACs, and UBCs associated with Building 447.

Building 448

Building 448 was added in 1962 as a shipping and storage facility for activities in Building 447. In 1969 an addition was added, between the original Building 447 and Building 444 to increase the storage space.

Building 450

Building 450 contains the mechanical equipment used to ventilate Building 444. The filter plenum consists of a two-stage HEPA filter system that vents to the outside atmosphere. In the event of a fire, firewater is collected at the bottom of the filter plenum and transported to Building 374 for treatment. Building 450 is not connected to the process waste system. See the Building 450 WSRIC for a detailed explanation of the Building 450 waste streams.

Building 451

Building 451 contains the mechanical equipment used to ventilate Building 444. The filter plenum consists of a two-stage HEPA filter system that vents to the outside atmosphere. In the event of a fire, firewater is collected at the bottom of the filter plenum and transported to Building 374 for treatment. Building 451 is not connected to the process waste system. See the Building 451 WSRIC for a detailed explanation of the Building 451 waste streams.

29

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Building 455

Building 455 contains the mechanical equipment used to ventilate the production plating lab in the Building 444 mezzanine. The filter plenum consists of a two-stage HEPA filter system that vents to the outside atmosphere. In the event of a fire, firewater is collected at the bottom of the filter plenum and later transported to Building 374 for treatment. Building 455 is not connected to the process waste system. See the Building 455 WSRIC for a detailed explanation of the Building 455 waste streams.

Current Operational Status

Buildings 444, 447, and 448 are currently going through equipment strip out in preparation for D&D activities. Building 450 and 451 are currently operational as the filter plenums for Building 444 and 447. Building 455 is currently out of service.

Contaminants of Concern

Asbestos

Describe any potential, likely, or known sources of Asbestos:

No comprehensive-asbestos surveys exist for Building 444, 447, and 488. Building 444, 447 and 448 are posted as potentially containing asbestos.

Beryllium (Be)

Describe any potential, likely, or known Be production or storage locations:

Buildings 444, 447, and 448 were used to manufacture depleted uranium and beryllium components. These beryllium process buildings are on the RFETS list of known Beryllium areas. See the RFETS list of known Be areas for a complete list of rooms. The Buildings 450, 451, and 455 are filter plenum building used to ventilate Building 444, 447 and 448 and are also on the site list of known Be areas.

Summarize any recent Be sampling results:

Building 444 Industrial Hygiene Department collects frequent Be samples from the Production Buildings 444, 447, and 448, as well as, the Buildings 450, 451, and 455 air plenums. See the Building 444 Industrial Hygiene Department for a list of recent Be samples collected.

Lead

Describe any potential, likely, or known sources of Lead (e.g., paint, shielding, etc.):

Lead in paint and lead in electrical equipment may be a concern due to the age of construction of the facilities addressed in this HSA. Lead shielding was used in the Building 444 and 447 NDT testing areas, and the beryllium counter in Building 444, Room 14. The lead shielding will be removed during equipment stripout. Lead shielding should not have been used in air plenums, Buildings 450, 451, and 455.

See the section below for RCRA/CERCLA constituents for lead in waste steam references related to Building 444 447, and 448.

30

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

RCRA/CERCLA Constituents

Describe any potential, likely, or known sources of RCRA/CERCLA constituents (e.g., chemical storage, waste storage, and processes):

Building 444 and 447 used a variety of RCRA/CERCLA constituents in the uranium and beryllium component manufacturing process. These constituents include, but are not limited to solvents, acids and metals. See the Building specific WSRIC for more detailed listing of the waste streams associated with each building addressed in this HSA.

Below is a list of RCRA units in Building 444:

RCRA Unit	Description	Status
39.01	Fabrication Unit	RCRA Stable
40.02	Acid waste Tank T-1	RCRA Stable
40.03	Acid waste Tank T-2	RCRA Stable
40.04	Process waste Tank T-2	RCRA Stable
40.05	Process waste Tank T-3	RCRA Stable
40.06	Cyanide waste Tank T-3	RCRA Stable
40.07	Cyanide waste Tank T-4	RCRA Stable
40.35	Filter System holding tank , T-4	RCRA Stable
40.36	Sump tank under Fabric filter	RCRA Stable

Below is a list of RCRA units in Building 447:

RCRA Unit	Description	Status
6	Chip Drum Storage	Closed
30	Chip Cementation Treatment Unit	Closed
39.2	Fabric Filtration Unit	Closed
40.37	Holding Tank T-6	RCRA Stable
45	Original Uranium Roaster	Closed

Buildings 448 450, 451, and 455 are not associated with any RCRA Units.

Describe any potential, likely, or known spill locations (and sources, if any):

Small volume spills occurred in the process areas discussed in the "Process History" section above and the RCRA Units listed above. Addition, RCRA/CERCLA release information is documented in the IHSS, PAC, and UBC section below.

Describe methods in which spills were mitigated, if any:

Spills were commonly cleaned by sweeping solids and using an adsorbent for liquids.

31

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

PCBs

Describe any potential, likely, or known sources of PCBs (e.g., light ballasts, paints, equipment, etc.):

Due to the age of these building there may be a concern with PCBs in paint, light ballasts, and electrical equipment. PCBs where not part of the standard manufacturing and machining processes performed in Building 444, 447, and 448.

Describe any potential, likely, or known spill locations (and sources, if any):

No known PCB spills occurred in any of the facilities addressed in this HSA.

Describe methods in which spills were mitigated, if any:

No known PCB spills occurred in any of the facilities addressed in this HSA.

32

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Radiological Contaminants

Describe any potential, likely, or known radiological production or storage locations:

Building 444, 447, and 448 make up the depleted uranium and beryllium manufacturing facilities. Buildings 450, 451, and 455 are air plenums that serviced these manufacturing facilities. All of these facilities HSA are radiologically posted. Enriched uranium and plutonium were not regularly handled in these facilities because these facilities lack the standard worker protection controls used in handling enriched uranium and plutonium, such as glove boxes, airlocks and criticality safe casting furnaces. However, in two separate Interviews, interviewees have identified rumors that in the mid 1950's recycled enriched uranium parts (possibly contaminated with Pu.) were occasionally handled in the furnaces in the Building 444 mezzanine. The casting furnace rooms in the Building 444 mezzanine have not been entered for approximately 13 years, so no data is available to confirm these rumors. Rumors also state that enriched uranium may have been machined in Room 101 on several occasions in the mid 1950s. These machines have since been removed and upgraded, and the work area cleaned during normal housekeeping activities.

Describe any potential, likely, or known spill locations (e.g., known leaking sealed radioactive sources, leaking waste drums, potentially contaminated drains, etc.):

Small volume leaks occurred in many of the waste management areas discussed in the "Process History" section and the RCRA Units listed above. In addition, release information is documented in the IHSS, PAC, and UBC section below.

Describe methods in which spills were mitigated, if any:

Spills were commonly cleaned by sweeping solids and using an adsorbent for liquids.

Describe any potential, likely, or known isotopes of concern (e.g., weapons grade plutonium, uranium isotopes, pure beta emitters, mixed fission products, etc.):

The primary Isotope of concern is depleted uranium (except as noted above). Other than sealed sources, there were no known mixed fission products or pure beta emitters used in any of the facilities addressed in the HSA. The element that sources were commonly made of included Californium, Co-60, Sr-90, Th-204 and Pm-147.

Describe any potential, likely, or known external facility contamination (e.g., stack release points, unfiltered ventilation, facility's physical location to known site releases, etc.):

See section below for information on IHSSs PACs, and UBCs.

33

**D&D RISS Facility Characterization
Historical Site Assessment Report
January, 2002 Rev. 0**

Environmental Restoration Concerns

Describe any ER concerns that could affect facility characterization (e.g., IHSSs, PACs, UBCs):

Building 444 is associated with the following active IHSSs, PACs, and UBCs;

- 1) IHSS 400-116.2 "South loading Dock", Active.
- 2) IHSS 400-157.2 "Radioactive Site South Area", Active.
- 3) IHSS 400-160 "Radioactive Site - 444 Parking lot", Active.
- 4) IHSS 400-182 "Building 444/453 Drum Storage Area", Active.
- 5) IHSS 400-207 "inactive 444 Acid Dumpster", Active.
- 6) IHSS 400-208 "Inactive 444/447 Waste Storage Area", Active.
- 7) IHSS 400-810 "Beryllium Fire - 444 Building", Active.
- 8) IHSS 400-814 "Air Conditioner Compressor release. Building 444 Roof" Proposed NFA HRR Quarterly update 1994.

Building 447 is associated with the following IHSSs, PACs, and UBCs;

- 1) IHSS 400-116.1 "West Loading Dock - Building 447", Active.
- 2) IHSS 400-157.2 "Radioactive Site South Area", Active.
- 3) IHSS 400-204 "Original Chip Roaster", Proposed NFA in the 1996 HRR Annual Update.
- 4) IHSS 400-801 "Transformer Leak on Roof of Building 447", Active.
- 5) PIC-14 "Building 448 cooling tower discharge", Active.

Buildings 444 and 447 have UBCs (Building 448 is included in the 447 UBC). Building 448, 450, 451, and 455 are filter Plenums and are not directly referenced in any IHSSs, PACs, and UBCs.

Additional events not documented in the individual IHSSs, but mentioned in the HRR report are:

- 1) In 1989 a plating bath tank overflowed releasing chromic acid to the Building 444 footing drain.
- 2) In 1990 a fire occurred in the plating lab in Room 245. The plating lab was moved to Rooms 212 and 212A. There was no known release to the environment.

Additional Information

Describe any additional information that may be useful during facility characterization (e.g., contaminant migration routes, waste handling operations, physical hazards, Historical Release Reports, WSRIC data, etc.):

See the Building 444 HRR for a more detailed summary of the Buildings 444, 447, 448, 450, 451, and 451 operational history.

References

Provide all sources of information utilized to gather data for facility history (e.g., documents, files, interviews):

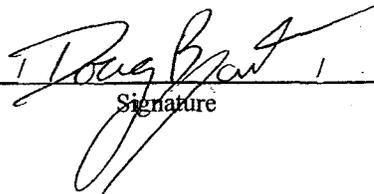

Sources reviewed to complete this HSA were the RFETS Facility List, the Historical Release Report, Site Master List of RCRA Units, and the Site IHSS, PAC, and UBC databases. Building 444, 447, 450, 451 and 455 WSRICs. In addition, a facility walkdown and interviews were performed.

Building 451	2800	0	3,800	0	0	TBD	0
Building 455	400	0	600	0	0	TBD	0
Further Actions <i>Recommend any further actions, if any (e.g., characterization, decontamination, special handling, etc.):</i> Begin the RLC/PDS process.							
Note: This HSA was performed prior to SME walkdowns, and chemical and radiological characterization package preparations. SMEs should evaluate and/or verify all information during the RLC/PDS process. SMEs may need to review additional documentation and perform additional interviews. Information contained in this HSA only represents a "snapshot" in time. Subsequent data may be obtained during SME walkdowns and chemical and radiological characterization package preparations, which may conflict with this report. However, this report will not be amended, and the newer data will take precedence over the data in this report. Newer Data will appear in the RLCR/PDSR.

Facility ID: Area 3 - B445, (Building 444 Group, Type 1 Facilities), which includes: Building 427/427A Emergency Generator/Diesel Storage Tank (aka Tank 068) for B444, S444 Bus Stop Car Pool Shelter, Building 445 Carbon Storage and Carbon Dust Collector, S445 Storage Shed, Building 449 Oil & Paint Storage, Building 449A Maintenance Annex, Building 449C Carpenter Shop, S449 Maintenance Storage, Building 453 Maintenance Storage, Building 454 Cooling Tower (444, 800 Tons), Building 457 Cooling Tower (447, 400 Tons), Building 447 Cooling Tower 1 of 3, Building 447 Cooling Tower 2 of 3, and Building 447 Cooling Tower 3 of 3

Anticipated Facility Type (1, 2, or 3): Building 427/427A Type = 1s, S444 = Type 1, Building 445 Type = 1, S445 = Type 1, Building 449 Type = 1, Building 449A Type = 1, Building 449C Type = 1, S449 Type = 1, Building 453 Type = 1, Building 454 Type = 1, Building 457 Type = 1, Building 447 Cooling Tower 1 of 3 = Type 1, Building 447 Cooling Tower 2 of 3 = Type 1, Building 447 Cooling Tower 3 of 3 = Type 1

This facility - specific Historical Site Assessment (HSA) has been performed in accordance with:

D&D Characterization Protocol, RFETS MAN-077-DDCP, latest version, and

Facility Disposition Program Manual, RFETS MAN-076-FDPM, latest version

Physical Description:

Building 427/427A is the Emergency Generator Building and Diesel Storage Tank facilities for Building 444. Building 427 has approximately 312 square feet of floor space and it is located near the southeast corner of Building 444. Tank 427A, aka Tank 068, is the Diesel Storage Tank for Building 427 and it is located directly north of the building in a concrete berm. Building 427 was constructed in 1975 and it is approximately 16 feet long X 15 feet wide X 12 feet high at the roof eave. The facility is constructed with concrete block on a steel reinforced concrete slab-floor and has a steel reinforced poured light-weight concrete flat roof.

S444 Bus Stop Car Pool Shelter is located directly north of Building 444 and north of Cottonwood Avenue. S444 is constructed from wood and covered with corrugated metal. S444 has a plywood floor. S444 has no heat and no electricity. S444 is approximately 10 feet wide X 12 feet long X 8 feet high at the roof eave and 10 feet high at the roof peak. S444 has two 3 feet X 3 feet X ¼ -inch Plexiglas® windows and two open doorways.

Building 445 has approximately 3,273 square feet of floor space. Building 445 was acquired/constructed in 1958 and is located directly east of the Building 444 and it is now attached to Building 444. Building 445 is 81 feet long X 40 feet wide X 20 high at the roof eave, and 30 feet high at the roof peak. The connecting section of Building 445 to Building 444 adds approximately 1,600 square feet (20 feet wide X 81 feet long) to the anticipated Type 1 Facility. The Building 445 to Building 444 Connecting Section has a flat built-up-roof with four roof drains and downspouts. Building 445's exterior walls and roof covered are with corrugated galvanized metal and sheet-type roof insulation and wall insulation. Building 445 is constructed on a concrete slab with a large steel roll-up door on the east and a steel personnel entry door on the north. Building 445 has 440-Volt electrical power, a natural-gas heater, electrical and gas re-circulating hot-water heat. Building 445 has a LSDW System.

S445 Storage Shed is an all wood constructed Maintenance storage facility which is located southeast of Building 445. The storage facility is approximately 18 feet long X 18 feet wide X 10 feet high at the roof eave and 16 feet high at the roof peak. S445 has 1-inch plywood walls, floor, and roof which is covered with sheet asbestos-type roofing material. S445 has one large sliding wood door. S445 has no electrical power, no heating of any kind, and does not have a LSDW System.

Building 449 Oil & Paint Storage is metal Butler-type building on a concrete slab and is located directly south of Building 444. The walls are galvanized metal sandwiched over insulation. Building 449 is 12 feet wide X 20 long X 12 feet high at the roof eave. The facility has a insulated metal roof and also has a large 16-foot wide by 10-foot high fold-up metal door on the north side and a metal personnel entry door on the northwest corner. The facility has electrical power and electrical baseboard heat.

**D&D RISS Facility Characterization
Historical Site Assessment Report
January 15, 2002, Rev. 0**

Physical Description (Con't):

Building 449A Maintenance Annex is located directly south of Building 444 and it consists of two 40 feet X 8 feet X 8 feet steel cargo containers connected together and 18-foot wide building and peaked roof section. The physical sized of Building 449A is approximately 34 feet wide X 40 feet long X 18 feet high at the roof peak.

Building 449C Carpenter Shop is located directly south of Building 449A and connects to the building. Building 449C is an all wood structure which is approximately 18 feet wide X 18 long feet X 12 feet at the roof eve and 18 feet tall at the roof peak. Building 449C has electrical power, electrical heat, and air-conditioning. Building 449C has a wood floor that is covered with 12" X 12" floor tile (probably not ACM tile).

S449 Maintenance Storage is an all wood constructed Maintenance storage facility which is located east of Building 449A/449C. The storage facility is approximately 40 feet long X 12 feet wide X 10 feet high at the roof eve. S449 has 1-inch plywood walls, floor, and roof which is covered with sheet asbestos-type roofing material. S449 has no electrical power, no heating of any kind, and does not have a LSDW System.

Building 453 Maintenance Storage is located directly west of Building 444 and contains approximately 384 square feet of floor space. Building 453 is approximately 16 feet wide X 24 feet long X 16 feet at the roof eve. Building 453 has a flat metal and built-up roof that slopes to the west for water drainage. Building 453 has two large metal roll-up doors; the one on the south is 10 feet wide and 12 feet tall and the one on the north is 8 feet wide and 12 feet tall. There is a personnel access door on the east side near the north wall.

Building 454 Cooling Tower is located directly east of Building 444 and its physical size is approximately 24 feet wide X 60 feet long X 10 feet high above the concrete mounting footings/foundation. Building 454 Cooling Tower is mounted on four 60-foot X 1-foot I-beams. The cooling tower's electrical panels are located on the exterior of the south wall.

Building 457 Cooling Tower is located directly west of Building 447 and its physical size is approximately 12 feet wide X 30 feet long X 12 feet high above the concrete mounting footings/foundation. Building 454 Cooling Tower is prefabricated steel structure mounted on concrete foundation/footings. The cooling tower's electrical panels are located on the east outside wall. Building 457 has a roof access steel ladder and the roof has 4-foot high hand-rails

Building 447 Cooling Tower 1 of 3 is located directly east of Building 447 at the southeast corner. The Cooling Tower 1 of 3 is approximately 12 feet wide X 16 feet long X 8 feet high and is an all metal piece of equipment mounted on a steel reinforced concrete pad approximately 13 feet wide X 17 feet long X 8 inches this plus concrete footings.

Building 447 Cooling Tower 2 of 3 is located directly south of Building 447. The Cooling Tower 2 of 3 is approximately 8 feet wide X 12 feet long X 12 feet high and is an all metal piece of equipment mounted on a steel framework that has concrete footings in the ground below.

Building 447 Cooling Tower 3 of 3 is located directly west of Building 447. The Cooling Tower 3 of 3 is approximately 5 feet wide X 6 feet long X 12 feet high and is an all metal piece of equipment mounted on a steel reinforced concrete pad approximately 7 feet wide X 7 feet long X 8 inches this plus concrete footings.

Historical Operations

Building 427/427A has always been the Emergency Generator Building and Diesel Storage Tank facilities for Building 444 since it was installed in 1975.

S444 Bus Stop Car Pool Shelter was used as such historically when Plant Buses made routine trips between the buildings at RFETS.

37

**D&D RISS Facility Characterization
Historical Site Assessment Report
January 15, 2002, Rev. 0**

Historical Operations (Con't)

Building 445 has historically been used as a carbon storage facility for the Building 444 Production Facility. Building 445 has two large saws that cut incoming carbon stock material that was machined into production casting molds for ingots and parts. Building 445 historically has also stored low-level contaminated waste drums and contaminated waste crates from Building 444. One interviewee said classified mold shapes at times were also stored in Building 445. Due to the materials stored in Building 445, it was generally posted as a RMA.

S445 Storage Shed has always been used as a Maintenance storage facility.

Building 449 Oil & Paint Storage facility was used for oil, paint, and equipment storage.

Building 449A Maintenance Annex was used by various Maintenance Groups to support Building 444 Operations.

Building 449C Carpenter Shop was used by Carpenters to support Building 444 Operations.

S449 Maintenance Storage was used by Maintenance as a miscellaneous storage facility.

Building 453 Maintenance Storage was used by Maintenance as a used Building 444 oil drum storage facility

Building 454 Cooling Tower has always been a cooling tower facility for Building 444.

Building 457 Cooling Tower has always been a cooling tower facility for Building 447.

Building 447 Cooling Tower 1 of 3 was always been a cooling tower facility for Building 447, Out of Service.

Building 447 Cooling Tower 2 of 3 was always been a cooling tower facility for Building 447, Out of Service.

Building 447 Cooling Tower 3 of 3 has always been a cooling tower facility for Building 447.

Current Operational Status

Building 427/427A currently is in service as Emergency Generator Building and Diesel Storage Tank facilities for Building 444.

S444 Bus Stop Car Pool Shelter is currently not being used.

Building 445 is currently is being used as a storage facility for Building 444. Building 445 currently has stored contaminated low-level waste drums and waste crates from Building 444. Building 445 currently has a fork-truck stored in the facility and there is a fork-truck charging station on the west wall of Room 700. There are two large graphite stock cutting saws in the west half of Room 700, along with a carbon-dust cyclone separator and vacuum pump system. Building 445 appears to be fully operational as a Building 444 Storage Facility, but the cutting saws and vacuum system do not appear to be currently used.

S445 Storage Shed currently is being used as Maintenance storage facility with a few cans of roofing tar.

Building 449 Oil & Paint Storage is currently in service with minimal use.

Building 449A Maintenance Annex is currently in service with minimal use by a Telecommunications Group.

Building 449C Carpenter Shop is currently in service with minimal use.

S449 Maintenance Storage is currently in service with minimal use.

Building 453 Maintenance Storage is Closed and Out of Service.

Building 454 Cooling Tower is currently in service.

Building 457 Cooling Tower is currently in service.

Building 447 Cooling Tower 1 of 3 is currently Out of Service.

Building 447 Cooling Tower 2 of 3 is disconnected and currently Out of Service.

Building 447 Cooling Tower 3 of 3 is disconnected and currently Out of Service.

Contaminants of Concern

Asbestos

Describe any potential, likely, or known sources of Asbestos:

Building 445 might have some asbestos containing materials (ACM) of construction because it was constructed in 1958.

Building 445's wall, roof, and pipe insulation might contain asbestos. One interviewee said low-level waste drums/crates containing asbestos were stored in Building 445, but that he did not believe the facility had any ACM materials of construction. Most of the other Building 444 Type 1 Facilities may have some ACM material of construction in wall, roof, and pipe insulation.

**D&D RISS Facility Characterization
Historical Site Assessment Report
January 15, 2002, Rev. 0**

Beryllium (Be)

Describe any potential, likely, or known Be production or storage locations:

Building 445 is on the RFETS Beryllium (Be) Areas Historical and Present list in Rooms 700, 700A, 700B, 700C and Room 700D. One interviewee said low-level waste drums/crates containing Be were stored in Building 445 and shipped out of the building through the east Trucking Door. Interviewees said that the used oil drums stored in Building 453 might have contained some Be. One interviewee said that the cooling tower pipes and sludge in the Building 454 Cooling Tower and the Building 457 Cooling Tower, might contain Be contamination. The Building 447 small cooling towers, 1 of 3, 2 of 3, and 3 of 3 might also contain some Be contamination. All of the rest of the Building 444 Type 1 Facilities such as Building 427, S444 Bus Stop Shelter, S445 Maintenance Storage, Building 449, Building 449A, Building 449C, and S449 Maintenance Storage would not be expected to have any Be contamination.

Summarize any recent Be sampling results:

No known recent Be sampling has been conducted in Building 445 or any of the other Building 444 Type 1 Facilities.

Lead

Describe any potential, likely, or known sources of Lead (e.g., paint, shielding, etc.):

Building 445 was constructed in 1958, therefore it may contain lead-based paints. No lead operations were known to have occurred in Building 445. All of the other Building 444 Type 1 Facilities that have paint on them, might have been painted with lead-based paints. Facilities S444 and S449 do not have any paint on them.

RCRA/CERCLA Constituents

Describe any potential, likely, or known sources of RCRA/CERCLA constituents (e.g., chemical storage, waste storage, processes):

Building 445 was never used as a chemical storage facility. Cleaning chemicals were used and stored in Building 445. Building 445 has no WSRIC, but it is included in the Building 444 WSRIC at one time. Building 445 is not listed on "The Master List of RCRA Units". Building 453 was at one time was a 90-day RCRA Storage Unit, but it is not now. Building 449 was known to have stored drums of product oil and product paint as well as paint thinners and other painting supplies.

Describe any potential, likely, or known spill locations (and sources, if any):

No known chemical spills ever occurred in Building 445. No known chemical spills occurred in the other Building 444 Type 1 Facilities. Oil and paint spills may have occurred in Building 449. Known oil spills did occur in and around Building 453.

Describe methods in which spills were mitigated, if any:

Unknown

PCBs

Describe any potential, likely, or known sources of PCBs (e.g., light ballasts, paints, equipment, etc.):

Building 445 may contain PCB/lead-based paints. Building 445 has lighting ballasts that might contain PCBs. No known equipment items containing PCBs, were ever located in Building 445. Lighting ballasts in other Building 444 Type 1 Facilities might contain PCBs.

Describe any potential, likely, or known spill locations (and sources, if any):

None

Describe methods in which spills were mitigated, if any:

None

**D&D RISS Facility Characterization
Historical Site Assessment Report
January 15, 2002, Rev. 0**

Radiological Contaminants

Describe any potential, likely, or known radiological production or storage locations:

Building 445 has had radiological contaminated drums and crates stored in Room 700. Building 445 stores low-level contaminated waste drums and low-level contaminated waste crates from Building 444 until shipments could be made out of the facility. Building 445 is currently posted as a RMA.

Describe any potential, likely, or known spill locations (e.g., known leaking sealed radioactive sources, leaking waste drums, potentially contaminated drains, etc.):

No known sealed radioactive sources were ever stored in Building 445.

Describe methods in which spills were mitigated, if any:

None

Describe any potential, likely, or known isotopes of concern (e.g., weapons grade plutonium, uranium isotopes, pure beta emitters, mixed fission products, etc.):

None

Describe any potential, likely, or known external facility contamination (e.g., stack release points, unfiltered ventilation, facility's physical location to known site releases, etc.):

None

Environmental Restoration Concerns

Describe any ER concerns that could affect facility characterization (e.g., IHSSs, PACs, UBCs):

IHSS/PAC 400-136.2 is very near the land for Building 445 and Building 454 Cooling Tower. Building 445 is anticipated to be a Type 1 Facility, but it falls under Building 444-UBC as shown on the Under Building Contamination Site Map. Building 453 sits in IHSS/PAC 400-182.

Additional Information

Describe any additional information that may be useful during facility characterization (e.g., contaminant migration routes, waste handling operations, physical hazards, Historical Release Reports, WSRIC data, etc.):

Building 445 is not listed in the RFETS Historical Release Reports. No WSRIC data currently exists for Building 445.

References

Provide all sources of information utilized to gather data for facility history (e.g., documents, files, interviews). Attach all applicable supporting documentation.

Sources reviewed to complete this HSA were the RFETS Facility list, the Historical Release Report, the Listing of Beryllium Areas Historical and Present, Site Master List of RCRA Units, and the Site IHSS, PAC, and UBC databases. Building 445 does not have a Facility Safety Analysis Report (FSAR) but it is included in the FSAR for Building 444. Building 445 does not have a WSRIC, but it is included in the Building 444 WSRIC. In addition, a facility walkdown of Building 445 was performed. The Facility Manager for Building 444 was interviewed for all the Building Type 1 Facilities and he was very familiar with every one of them, except he knew very little about the Maintenance and Maintenance Storage Facilities.

Waste Volume Estimates and Material Types For Building 427, Building 444 Type 1 Facility

Concrete (cu ft)	Wood (cu ft)	Metal (cu ft)	Corrugated Sheet Metal (cu ft)	Wall Board (cu ft)	ACM	Other Waste (cu ft)
1,500	None	240	None	None	TBD	30 cu ft insulation

 Purpose: Reconnaissance Level Characterization
 RWP #: N/A
 Date: 6/13/02 Time: 1030

PRN/REN #: N/A
 Comments: Survey of floors and walls at locations < 2m. All locations were scanned and readings greater than investigation limits are shown on pg. 2.

TSA - DATA SUMMARY**

Sample Location Number	Instrument ID#:	Sample Gross Counts (cpm)	Sample Gross Activity (dpm/100cm ²)	LAB Gross Counts (cpm)	LAB Gross Activity (dpm/100cm ²)	Sample Net Activity (dpm/100cm ²) ¹
------------------------	-----------------	---------------------------	---	------------------------	--	--

TSA Data Summary Comments

Initial Sample Net Activity results:

<u>Location</u>	<u>Initial Survey result (dpm/100cm²)</u>	<u>Action/Investigation</u>
35	52.7	High background - re-survey results reported - See Note 1 below
45	64.3	High background - re-survey results reported - See Note 1 below
85	102.4	re-survey still elevated - operating plenum, coupon not collected - See Note 2 below
90	140.8	coupon collected and analyzed - See Note 3 below
112	118.4	media sample collected and analyzed - See Note 5 below
137	275.9	re-survey still elevated - operating plenum, coupon not collected - See Note 2 below
143	102.4	re-survey results reported
151	126.0	re-survey results reported
183	269.5	coupon collected and analyzed - See Note 3 below
198	266.3	coupon collected and analyzed - See Note 3 below
208	133.7	re-survey still elevated - operating plenum, coupon not collected - See Note 2 below
174 QC	148.4	on dock - all docks will undergo another PDS prior to demolition

- 1.) The initial survey for locations 35 and 45 had elevated background levels (65.3 and 116.8 dpm/100cm², respectively) These locations were re-surveyed. Re-survey results are reported.
- 2.) Locations 85, 137, and 208 are exposed metal on the exterior of operating plenums. Coupon samples were not obtained because the plenums are still in use. However, nine (9) coupon samples were collected from similar surfaces from roof locations in the B444 cluster and analyzed using the Canberra ISOCs system. No transuranic isotopes were detected from these metal coupons. All sample activity on exposed metal was determined to be from uranium and naturally occurring isotopes. The Sample Net Activity for each location is below the DCGL_w limits (5000 dpm/100cm²) for uranium. All survey results are less than the applicable DCGLs, therefore, no further investigation is required. On this basis, transuranic values for locations 85, 137, and 208 are reported as zero (0) net activity in the TSA Data Summary.
- 3.) Coupon samples were collected from locations 90, 183, and 198 and analyzed using the Canberra ISOCs system. No transuranic isotopes were detected. Roof sample activity was determined to be from uranium and naturally occurring isotopes. The Sample Net Activity for each location is below the DCGL_w limits (5000 dpm/100cm²) for uranium. All survey results are less than the applicable DCGLs, therefore, no further investigation is required. On this basis, transuranic values for locations 90, 183, and 198 are reported as zero (0) net activity in the TSA Data Summary.
- 4.) Locations 143 and 151 had initial elevated survey results. These locations were re-surveyed. Re-survey results are reported.
- 5.) A media sample was collected from the concrete surface at location 112 and analyzed using the Canberra ISOCs system. No transuranic isotopes were detected, therefore a value of zero is reported in the TSA data summary. The media sample results were converted to dpm/100cm² as calculated on the Media Sample Conversion sheet. The calculated uranium value of 245.7 dpm/100cm² is below the DCGL_w limits (5000 dpm/100cm²) for uranium. All survey results are less than the applicable DCGLs, therefore, no further investigation is required.
- 6.) Elevated fixed contamination levels were discovered during the scan survey of the southeast wall and dock. Follow up action included notification of building and characterization team supervision, additional removable contamination surveys, and additional beta scan surveys at each access portal (doors, docks, roll-up doors, etc.) throughout the B444 cluster. Beta scans were performed because uranium is the primary radioactive contaminant. All scanned areas with elevated beta count rates were marked to indicate probable fixed contamination areas. Many parts of these areas are not contaminated above the DCGL_w limits, however they are marked to ensure that all contamination is bounded within the markings as indicated on the map. Fixed contamination was also found on some asphalt and is shown on the map. All access portals within the B444 Cluster will be re-surveyed to PDS criteria prior to final demolition of the buildings.
- 7.) Location QC 174 was surveyed twice. The second survey result was 126 dpm/100cm². This confirms the elevated activity of the initial QC measurement at this location. This location is located on a dock with sporadic contamination and will be re-surveyed to PDS criteria prior to final demolition of the buildings.

 Line Item Code : RC10B019

Concrete media Sample

Filename: A:\G1900053.CNF

Location 112

Sample Number : 02S0210-020.001
 Lab Sample Number : CMLS-1594
 Sample Receipt Date : 8/12/2002
 Sample Volume Received : 2.86E+001 Grams

Result Identifier : N/A

Peak Locate Threshold : 3.00
 Peak Locate Range (in channels) : 100 - 8192
 Peak Area Range (in channels) : 100 - 8192
 Identification Energy Tolerance : 1.000 keV

Sample (Final Aliquot Size) : 2.863E+001 Grams
 Sample Quantity Error : 0.000E+000
 Systematic Error Applied : 0.000E+000

Sample Taken On : 8/09/2002 10:37:00 AM
 Acquisition Started : 8/13/2002 3:27:47 PM

Count Time : 86400.0 seconds
 Real Time : 86468.6 seconds
 Dead Time : 0.08 %

Energy Calibration Used Done On : 7/01/02
 Energy = -0.102 + 0.250*ch + -3.87E-008*ch^2 + 2.95E-012*ch^3

Corrections Applied:
None

1 -The initial Sample Net Activity for roof locations 5, 6, and 9 were 245.9, 238.4, and 179.1 dpm/100cm² respectively.
 A coupon sample was collected from locations 5 and 9 and analyzed using the Canberra ISOCS system. No transuranic isotopes were detected. Roof sample activity was determined to be from uranium and naturally occurring isotopes.
 The Sample Net Activity for each of these locations is below the uranium DCGL_w limits (5000 dpm/100cm²).
 All survey results are less than the applicable DCGLs, therefore, no further investigation is required.
 On this basis, transuranic values for locations 5, 6, and 9 are reported as zero (0) net activity in the TSA Data Summary.

1 - The initial Sample Net Activity for Sample Location 17 was 107.7 dpm/100cm². This location was resurveyed after a decay period. Resurvey results (174.3 dpm/100cm²) were still above the transuranic DCGL_w (100 dpm/100cm²). A coupon sample was not obtained because the plenum is still in use. However, nine (9) coupon samples were collected from similar surfaces throughout the B444 cluster and analyzed using the Canberra ISOCs system. No transuranic isotopes were detected from these exposed metal coupons. All roof sample activity was determined to be from uranium and naturally occurring isotopes. The Sample Net Activity of 174.3 dpm/100cm² is below the uranium DCGL_w limits (5000 dpm/100cm²). All survey results are less than the applicable DCGLs, therefore, no further investigation is required. On this basis, the transuranic value for location 17 is reported as zero (0) net activity in the TSA Data Summary.

1 -The initial Sample Net Activity for roof locations 3, 8, and 9 were 162.3, 145.9, and 159.3 dpm/100cm² respectively.
 A coupon sample was collected from locations 3 and 9 and analyzed using the Canberra ISOCS system. No transuranic isotopes were detected. Roof sample activity was determined to be from uranium and naturally occurring isotopes.
 The Sample Net Activity for each of these locations is below the uranium DCGL_w limits (5000 dpm/100cm²).
 All survey results are less than the applicable DCGLs, therefore, no further investigation is required.
 On this basis, transuranic values for locations 3, 8, and 9 are reported as zero (0) net activity in the TSA Data Summary.

and Sample Maps

RCRA/CERCLA Constituents Data Summary

Sample Location / Media/Sample Number	Analysis	Result (mg/L)
Bldg 444, Concrete Slab, Locations 02S0183-001-009, 011-017	RCRA Metals, SVOC, and VOC	RCRA Toxicity Characteristic substances less than regulatory limits, RCRA Listed substances not applicable.
Bldg 444, Concrete Slab, Locations 02S0198-001-008, 011	RCRA Metals, SVOC, and VOC	RCRA Toxicity Characteristic substances less than regulatory limits, RCRA Listed substances not applicable.
Bldg 444, Concrete Slab, Location 02S0200-001	RCRA Metals, SVOC, and VOC	RCRA Toxicity Characteristic substances less than regulatory limits, RCRA Listed substances not applicable.

RCRA Toxicity Characteristic Limits

Analyte	Regulatory limit (mg/L)
Arsenic (D004)	5.0
Barium (D005)	100.0
Benzene (D018)	0.5
Cadmium (D006)	1.0
Carbon tetrachloride (D019)	0.5
Chlordane (D020)	0.03
Chlorobenzene (D021)	100.0
Chloroform (D022)	6.0
Chromium (D007)	5.0
o-Cresol (D023)	200.0 (a)
m-Cresol (D024)	200.0 (a)
p-Cresol (D025)	200.0 (a)
Cresol (D026)	200.0 (a)
2,4 -D (D016)	10.0
1,4 Dichlorobenzene (D027)	7.5
1,2 Dichloroethane (D028)	0.5
1,1 Dichlorethylene (D029)	0.7
2,4 Dinitrotoluene (D030)	0.13 (b)
Endrin (D012)	0.02
Heptachlor - and its epoxide (D031)	0.008
Hexachlorobenzene (D032)	0.13 (b)
Hexachlorobutadiene (D033)	0.5
Hexachloroethane (D034)	3.0
Lead (D008)	5.0
Lindane (D013)	0.4
Mercury (D009)	0.2
Methoxychlor (D014)	10.0
MEK (D035)	200.0
Nitrobenzene (D036)	2.0
Pentachlorophenol (D037)	100.0
Pyridine (DD038)	5.0 (b)
Selenium (D010)	1.0
Silver (D011)	5.0
Tetrachloroethylene (D039)	0.7

296

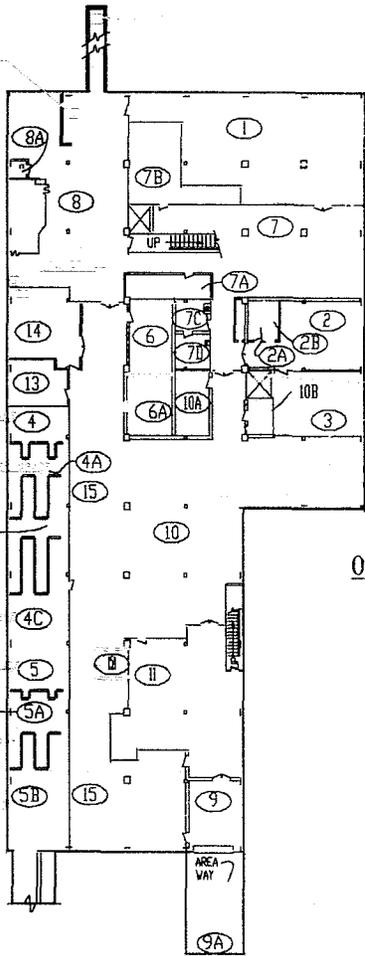

Toxaphene (D015)	0.5
Trichloroethylene (D040)	0.5
2,4,5-Trichlorophenol (D041)	400.0
2,4,6-Trichlorophenol (D042)	2.0
2,4,5-TP (Silvex) (D017)	1.0
Vinyl Chloride (D043)	0.2

- (a) Quantitation Limit is greater than the calculated regulatory level. The quantitation limit therefore becomes the regulatory level.
(b) If o-, m-, and p-Cresol concentrations cannot be differentiated, the total Cresol (D026) concentration (200mg/l) is used.

Data Quality Assessment (DQA) Detail

DATA QUALITY ASSESSMENT (DQA)

VERIFICATION & VALIDATION OF RESULTS

V&V of the data confirm that appropriate quality controls are implemented throughout the sampling and analysis process, and that any substandard controls result in qualification or rejection of the data in question. The required quality controls and their implementation are summarized in a tabular, checklist format for each category of data – radiological surveys and chemical analyses [specifically beryllium, asbestos, metals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and PCBs.]

DQA criteria and results are provided in a tabular format for each suite of surveys or chemical analyses performed; the radiological survey assessment is provided in Table E-1, beryllium in E-2, asbestos in E-3, metals in E-4, VOCs in E-5, SVOCs in E-6 and PCBs in E-7. A data completeness summary for all results is given in Table E-8.

All relevant Quality records supporting this report are maintained in the RISS Characterization Project File. The report will be submitted to the CERCLA Administrative Record for permanent storage within 30 days of approval by the Regulators. All radiological data are organized into Survey Packages, which correlate to unique (MARSSIM) Survey Areas and/or Survey Units. Chemical data are organized by RIN (Report Identification Number) and are traceable to the sample number and corresponding sample location.

Beta/gamma survey designs were implemented for the 444 Cluster anticipated Type 2 facilities based on the uranium limits used as DCGLs in the unrestricted release decision process. Elevated activity on exterior Survey Unit sample locations had coupon samples taken and analyzed by ISOCS Canberra gamma spectroscopy. No transuranic isotope activity was detected. Elevated activity was determined to be uranium and/or other naturally occurring isotope activity. Consequently, all results were evaluated against, and were less than the uranium DCGL_w (5000/dpm/100cm²) unrestricted release limits. On this basis, transuranic sample net activity was reported as zero (0) in the TSA Data Summaries.

Consistent with EPA's G-4 DQO process, the radiological survey design (for those units performed per PDS requirements, i.e., building and exterior survey units) was optimized by checking actual measurement results (acquired during pre-demolition surveys) against model output with original estimates. Use of actual sample/survey (result) variances in the MARSSIM DQO model confirms that an adequate number of surveys were acquired.

SUMMARY

In summary, the data presented in this report have been verified and validated relative to quality requirements and project decisions as stated in the original DQOs. All data are useable based on the qualifications stated herein and are considered satisfactory without qualification, except the following locations identified during this RLC as containing contaminants above unrestricted release levels:

305

- Asbestos Containing Materials (ACM) above unrestricted release levels – B444 (1st floor interior and roof exterior– 30 locations), B444 (2nd floor and basement interior – 21 locations), B445 interior – 21 locations and B447 interior – 14 locations. These areas will be abated during in-process decontamination and decommissioning activities and successful decontamination will be confirmed during final asbestos abatement clearance sampling.
- The radiological survey/sampling was conducted in accordance with the RLCP developed as part of this RLCR. All radiological survey/sampling conducted for the Survey Areas and Survey Units comprising this RLCR satisfied project DQOs. The nature and extent of radiological characterization (i.e., transuranic and uranium contamination) was adequately characterized, radiological data is commensurate with the anticipated facility typing (i.e., Type 2 facility), data met minimum RLC quality requirements for action levels and release criteria, and survey areas/units were properly bounded and defined. The below listed Survey Areas were surveyed per RLC requirements, and the Survey Units surveyed per PDS requirements. Below is a summary of the radiologically contaminated areas identified in this RLCR:
 - One Hundred and Thirteen (113) radiologically contaminated measurement locations (both alpha and beta) were identified above the transuranic DCGL_w (100 dpm/100cm²) and uranium DCGL_w (5000 dpm/100cm²) unrestricted release levels for the following Survey Areas: Survey Area B (B444-Part 2), Survey Area C (B444-Part 3), Survey Area E (B444 basement), Survey Area F (B444 2nd floor), Survey Area G (B447) and Survey Area K (B444/447 Sumps, Pits, and trenches). These areas will be decontaminated during in-process decontamination and decommissioning activities and/or disposed of as low level or low level mixed waste. The nature and extent of radiological contamination support the classification of an anticipated Type 2 facility.
 - Elevated readings were identified at exterior sample locations for Survey Units 444-B-009 through 444-B-013. Four locations were allowed to decay per RSP 16.02 requirements and re-surveyed. Re-survey results were below the DCGL_w unrestricted release limits. Two survey locations had high backgrounds, were re-surveyed with both results less than the DCGL_w unrestricted release limits. Elevated activity was identified at fourteen (14) locations on roof exteriors of the subject survey units. The investigation included selecting coupon samples for analysis by Canberra ISOCS gamma spectroscopy. No transuranic isotope activity was detected. All elevated activity was determined to be uranium and other naturally occurring isotopes. The Sample Net Activity for each of these locations was below the uranium DCGL_w (5000 dpm/100cm²). On this basis, the transuranic values for these locations are reported as zero (0) in the TSA Data Summary. As a result, all survey results are less than the applicable DCGL_w unrestricted release limits and no further investigation is required.

- Extensive beryllium sampling was conducted in the B444 Type 2 facilities during the period of 1993 through the present. The beryllium sampling data collected during the period of January 1999 through August, 2002 is contained in the RFETS Industrial Hygiene Information System (IHIS). Table 4-1, *Summary of IHIS Data for Buildings 444, 445, 447, 448 and Plenum Buildings (450, 451, 455)*, summarizes the IHIS data and details the range and location of beryllium contamination by building and room (refer to Attachment D-2 of this RLCR).

Additional beryllium samples were collected as part of this RLCR based on the Chemical Characterization Plan developed per RLCP requirements. Fifty-One (51) beryllium samples were collected in previously inaccessible areas of the 444 Cluster (i.e., sumps, pits and trenches). The results of this sampling identified 4 locations above the investigative level ($0.1 \mu\text{g}/100\text{cm}^2$) and 6 locations above the action level ($0.2 \mu\text{g}/100\text{cm}^2$). The results of the beryllium data collected as part of this RLCR support the project decisions to classify the 444 Cluster as a Type 2 facility.

- Two PCB sample locations were identified above the regulatory limit of 50 ppm in B444, Room 245. Sample locations 02S0198-003 and 02S0198-008 have PCB contamination of 150 ppm and 180 ppm respectively. The area affected is approximately 100 square feet. These areas will be managed and disposed of in accordance with 40CFR761 as part of the in-process D&D activities.

The above referenced contaminated areas will be remediated during in-process D&D activities. PDS will confirm the satisfactory decontamination of the subject areas as applicable. Chain of Custody was intact; documentation was complete, hold times were acceptable (where applicable,) and packaging integrity/custody seals were maintained throughout the sampling/analysis process. On this basis, the Survey Units/Survey Areas identified in this RLCR meet the confidences stated herein and confirm project decisions, (i.e., classification as Type 2 facilities).

Table E-8 Data Completeness Summary For Building 444 Anticipated Type 2's

ANALYTE	Building/Area /Unit	Sample Number Planned (Real & QC)	Sample Number Taken (Real & QC)	Project Decisions (Conclusions) & Uncertainty	Comments (RIN, Analytical Method, Qualifications, etc.)
		(biased) 1 m ² scan @ each location-floors and walls < 2 m	(biased) 1 m ² scan @ each location-floors and walls < 2 m		
Radiological	Survey Area B Survey Unit: 444-B-009 B444 (exterior)	231 & TSA and 231 & Smears (random) 12 QC TSA 3% scan	231 & TSA and 231 & Smears (random) 12 QC TSA 3% scan	No contamination at any locations; all values below unrestricted release levels	<p>Uranium and/or Transuranic DCGL as applicable.</p> <ul style="list-style-type: none"> Elevated background readings at survey locations #35 and #45. Locations were re-surveyed with both results below the DCGL_w (100 dpm/100cm²). Elevated survey results at locations #143 and #151. Locations were re-surveyed and were below the DCGL_w (100 dpm/100cm²). Re-survey results are reported in the TSA Data Summary for the above four (4) locations. Elevated activity was identified at locations #85, #90, #137, #183, #198 and #208 above the DCGL_w (100 dpm/100cm²) unrestricted release limits. Coupon samples taken and analyzed by gamma spectroscopy did not detect any transuranic isotope activity. Elevated activity was determined to be uranium and other naturally occurring isotopes. All results were less than the uranium DCGL_w (5,000 dpm/100cm²) unrestricted release limits. On this basis, the transuranic net activity values are reported as zero (0) in the TSA Data Summary. Elevated activity was identified at location #112. A media sample was collected from concrete surface and analyzed by gamma spectroscopy. No transuranic isotope activity was detected. Elevated activity was determined to be uranium and other naturally occurring isotopes. The media sample result was less than the

325

Table E-8 Data Completeness Summary For Building 444 Anticipated Type 2's

ANALYTE	Building/Area /Unit	Sample Number Planned (Real & QC)	Sample Number Taken (Real & QC)	Project Decisions (Conclusions) & Uncertainty	Comments (RIN, Analytical Method, Qualifications, etc.)
					uranium DCGL _w (5,000 dpm/100cm ²) unrestricted release limits. On this basis, the transuranic net activity value is reported as zero (0) in the TSA Data Summary.
Radiological	Survey Area B Survey Unit: 444-B-010 B447 (exterior)	40 α TSA and 40 α Smears (29 random & 11 biased) 2 QC TSA 3% scan	40 α TSA and 40 α Smears (29 random & 11 biased) 2 QC TSA 3% scan	No contamination at any location; all values below unrestricted release levels	Uranium and/or Transuranic DCGL as applicable. Initial elevated alpha activity at survey location #12 (128 dpm/100cm ²). Location was allowed to decay per RSP 16.02 requirements and re-surveyed 8/6/02. The re-survey result was 53.3 dpm/100cm ² which is less than the DCGL _w (100 dpm/100cm ²) therefore all values are below unrestricted release levels. The re-survey value is reported in the TSA Radiological Data Summary.
Radiological	Survey Area B Survey Unit: 444-B-011 B448 & B450 (exterior)	25 α TSA and 25 α Smears (15 random & 10 biased) 2 QC TSA 3% scan	25 α TSA and 25 α Smears (15 random & 10 biased) 2 QC TSA 3% scan	No contamination at any location; all values below unrestricted release levels	Uranium and/or Transuranic DCGL as applicable. Elevated alpha activity was detected on B448 roof at sample locations #5 (245.9 dpm/100cm ²), #6 (238.4 dpm/100cm ²) and #9 (179.1 dpm/100cm ²) that were greater than the DCGL _w (100 dpm/100cm ²). Two coupon samples were taken at locations #5 and #9 and analyzed by gamma spectroscopy. No DOE- Added (americium and plutonium)

326

Table E-8 Data Completeness Summary For Building 444 Anticipated Type 2's

ANALYTE	Building/Area /Unit	Sample Number Planned (Real & QC)	Sample Number Taken (Real & QC)	Project Decisions (Conclusions) & Uncertainty	Comments (RIN, Analytical Method, Qualifications, etc.)
Radiological	Survey Area B Survey Unit: 444-B-012 B451 & B455 (exterior)	25 α TSA and 25 α Smears (15 random & 10 biased) 2 QC TSA 3% scan	25 α TSA and 25 α Smears (15 random & 10 biased) 2 QC TSA 3% scan	No contamination at any location; all values below unrestricted release levels	isotope activity was detected. Results indicated only uranium contamination and other naturally occurring isotopes were present. The net activity of 245.9 dpm/100cm ² (highest net activity) is below the DCGL _w (5,000 dpm/100cm ²) limits for uranium. Therefore, all survey results are less than the applicable DCGL _w unrestricted release limits and no further investigation is required. Uranium and/or Transuranic DCGL as applicable.
Radiological	Survey Area B Survey Unit: 444-B-013 B445 (exterior)	25 α TSA and 25 α Smears (15 random & 10 biased) 2 QC TSA 3% scan	25 α TSA and 25 α Smears (15 random & 10 biased) 2 QC TSA 3% scan	No contamination at any location; all values below unrestricted release levels	Elevated alpha activity was detected on the roof of B451 at sample location #17 (107.7 dpm/100cm ²) that was greater than the DCGL _w (100 dpm/100cm ²). The location was allowed to decay and re-surveyed with net activity of 174.3 dpm/100cm ² . Nine coupon samples were taken from roof locations in the B444 cluster and analyzed by gamma spectroscopy. No DOE- Added (americium and plutonium) isotope activity was detected at any of the locations. All activity was determined to be uranium contamination and other naturally occurring isotopes. Consequently, the net activity of 174.3 dpm/100cm ² is below the DCGL _w (5,000 dpm/100cm ²) limits for uranium and is the net activity value reported in the Radiological Data Summary. All survey results are less than the applicable DCGL _w unrestricted release limits and no further investigation is required. Uranium and/or Transuranic DCGL as applicable. Elevated alpha activity was detected on the roof of B445 at sample locations #3 (162.3 dpm/100cm ²), #8 (145.9 dpm/100cm ²) and #9 (159.3 dpm/100cm ²) that were greater than the DCGL _w (100 dpm/100cm ²). Two coupon samples

327

Table E-8 Data Completeness Summary For Building 444 Anticipated Type 2's

ANALYTE	Building/Area /Unit	Sample Number Planned (Real & QC)	Sample Number Taken (Real & QC)	Project Decisions (Conclusions) & Uncertainty	Comments (RIN, Analytical Method, Qualifications, etc.)
					were taken from the two highest net activity roof locations (#3 and #9) and analyzed by gamma spectroscopy. No DOE- Added (americium and plutonium) isotope activity was detected at any of the locations. All activity was determined to be uranium contamination and other naturally occurring isotopes. Consequently, the highest sample net activity of 162.3 dpm/100cm ² is below the DCGL _w (5,000 dpm/100cm ²) limits for uranium and is the net activity value reported in the Radiological Data Summary. All survey results are less than the applicable DCGL _w unrestricted release limits and no further investigation is required.

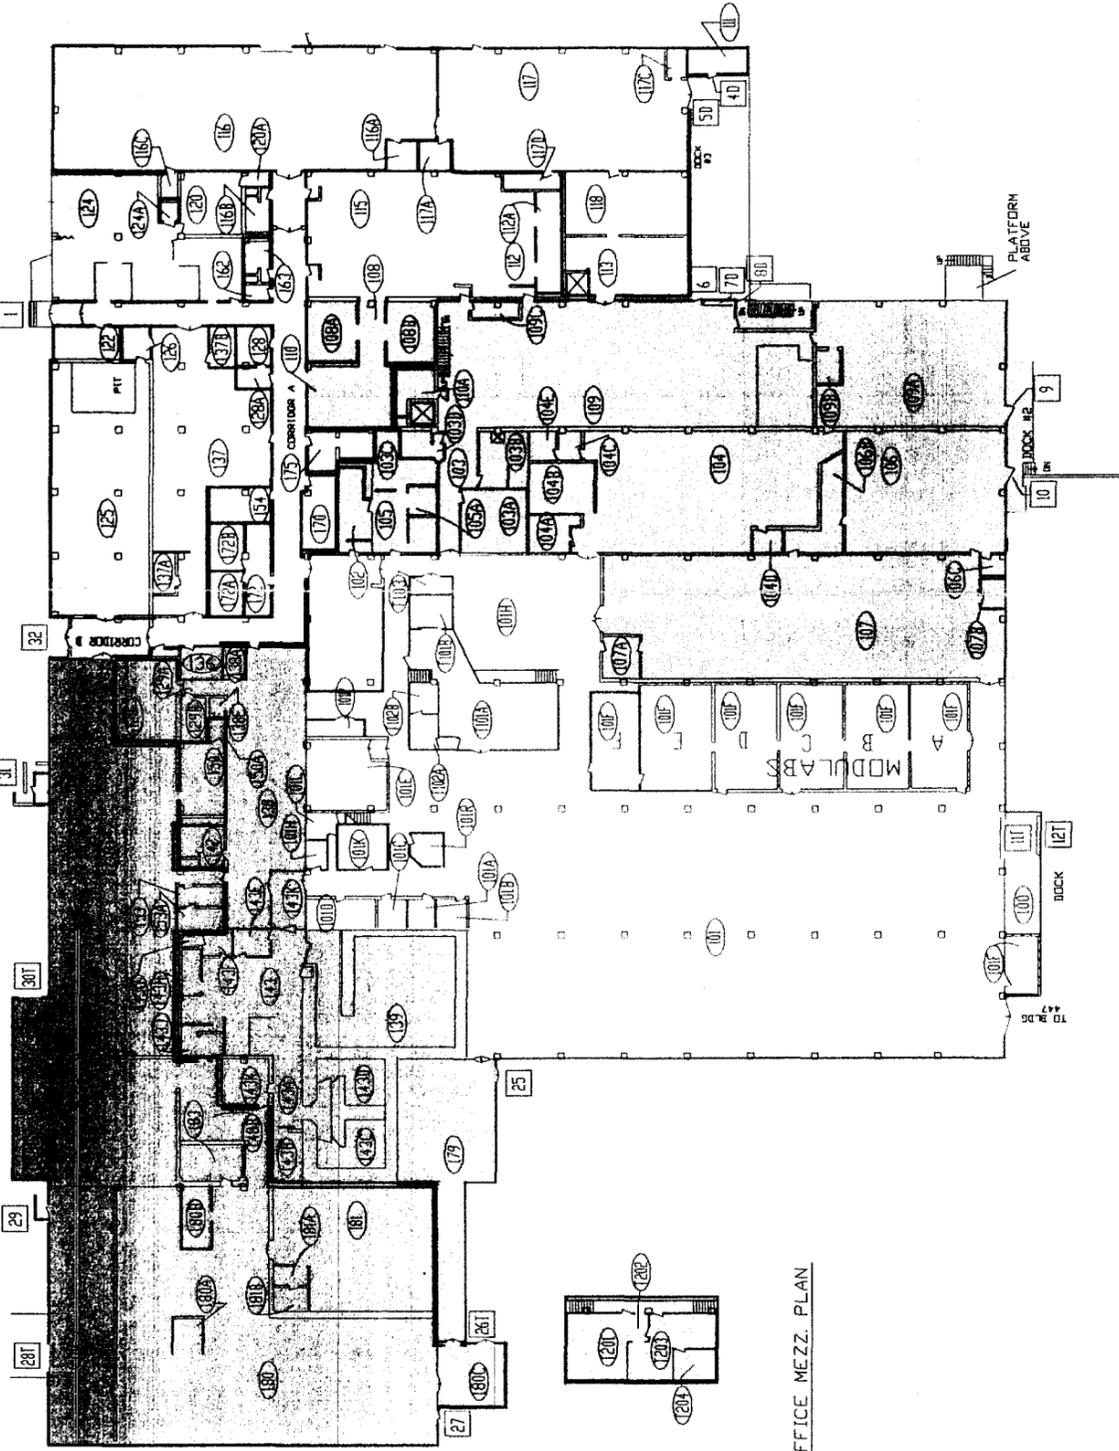

^A Number of asbestos samples required was an estimate only, final number of samples is at the discretion of IH.
