Introduction

Survey 72901020 was conducted on April 23, 1999 by STANLEY/PILKINGTON as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901020 ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 171 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}

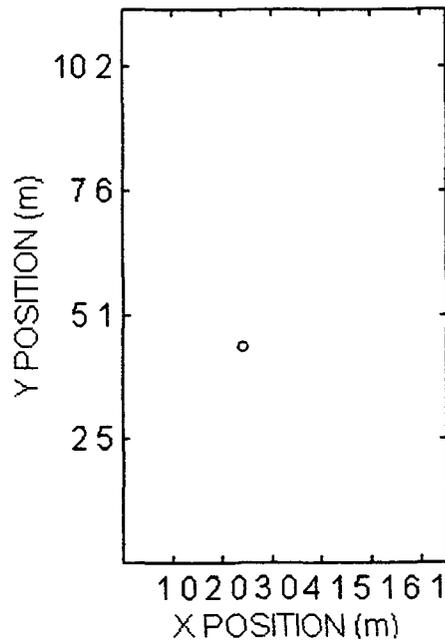

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

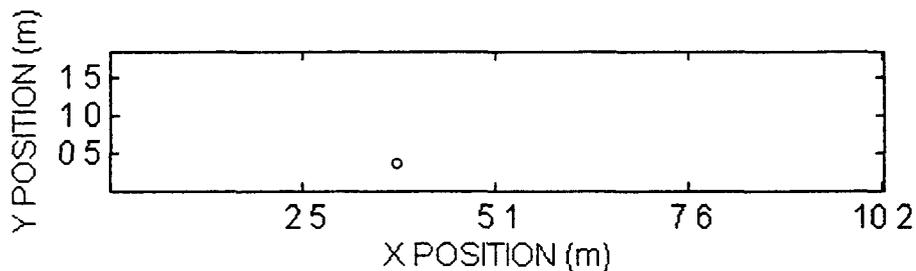

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria
100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits
DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were the DCGL_{EMC}.

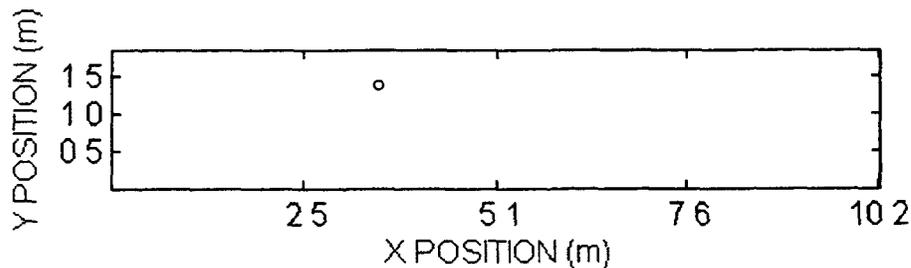

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

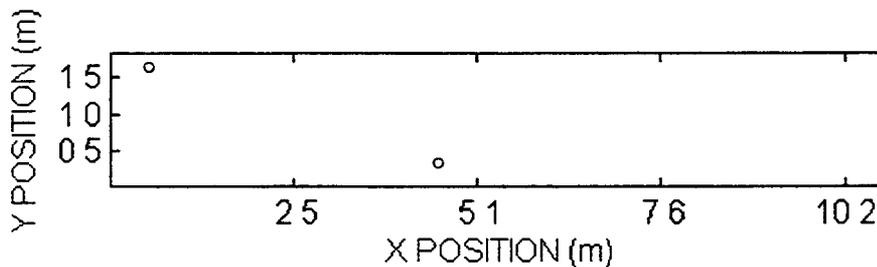

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

8

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}

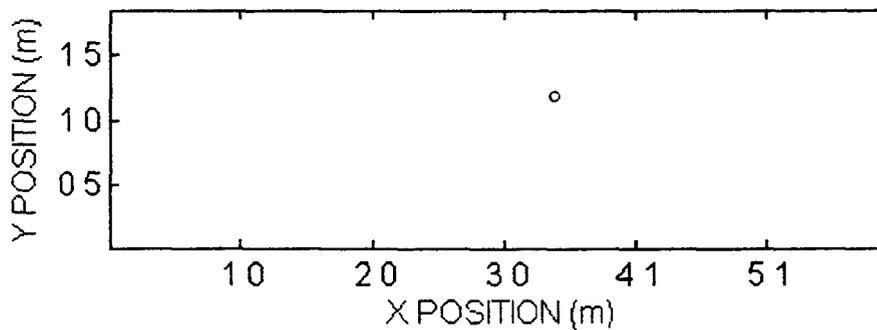

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}

9

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

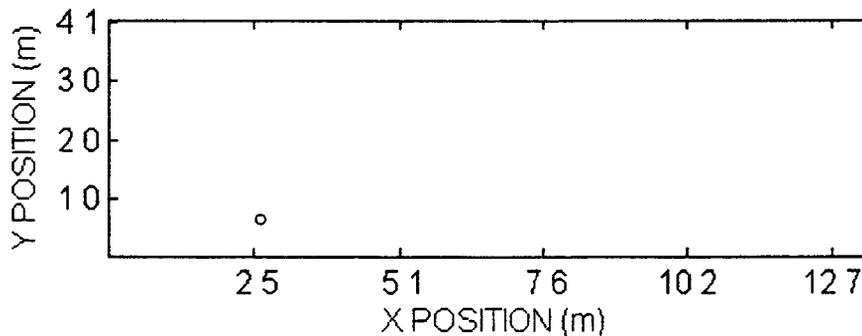

Figure 3. Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

72901 TSA Data Frequency Plot

Total Surface Activity Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72901 data are calculated on the "Survey Area A Building 729 Total Surface Contamination Results" form. Because all total surface activity (TSA or TSC) measurement results are less than DCGL_w (less than 100 dpm/100 cm²), the survey unit clearly meets the TSA release criterion.

A graphical data review was also performed on the attached form. The posting plot indicated that spatial trends of elevated areas are not present. The histogram indicated that no isolated areas of elevated activity are present.

Step 2

Select the statistical tests. The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Total Surface Activity Measurement Calculation Worksheet") was based on the use of this test. An average local area background (LAB) value was subtracted from each gross measurement to calculate a net result, thus the sign test applies (sign test is typically applied only when the contaminant is not present in background).

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3

Verify the assumptions of the test. The sign test assumes that the data from the survey unit consists of independent samples from each distribution. This assumption is verified per the posting plot (see Step 1), that indicates that spatial dependencies do not exist in the survey unit.

The assumed data variance, as indicated by the assumed standard deviation (see "Total Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation.

The actual sample standard deviation for 72901 is 9.3.

Thus, the ACTUAL required number of samples is as follows:

$$\Delta/\delta = (DCGL_{TSA} - LBGR_{TSA}) / SD_{TSA}$$

$$\Delta/\delta_{transuranics} = \underline{7.1} = (100 \text{ dpm}/100\text{cm}^2 - 34 \text{ dpm}/100\text{cm}^2) / 9.3 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty.

DCGL_{TSA} is the total surface Activity derived concentration guideline value (DOE Order 5400.5 total surface Activity limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium, per the B779 Cluster Radiological Closeout Survey Plan).

LBGR_{TSA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor.

SD_{TSA} is the ACTUAL standard deviation of the total surface Activity.

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

Step 3 Continued

Determine the number of TSA surface Activity measurements for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium contaminants not being present in the

24

Total Surface Activity Summary Statistics Calculation Worksheet

background

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = \underline{10.9}$$

Where

1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5.5.2.3

$$N = \underline{10.9} * 1.2 = \underline{13}$$

Conclusion Utilizing a conservative relative shift value of 3.0, a minimum of 13 Total Surface Activity measurements was required in 72901

Step 5

Draw conclusions from the data All measurements are less than DCGL_w. The minimum number of required TSA measurements were collected. This survey unit 72901 complies with the TSA release criteria.

4/24/99

Date

4/24/99

Date

Removable Contamination Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72901 removable surface contamination data are calculated on the "Survey Area A Building 729 Surface Media Survey Results" form. Because all removable survey measurement results are less than DCGL_w (less than 20 dpm/100 cm²), the survey unit clearly meets the removable contamination release criterion.

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Removable Surface Activity Measurement Calculation Worksheet") was based on the use of this test.

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3

Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Removable Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of smears with the ACTUAL survey unit standard deviation.

The actual removable survey standard deviation for 72901 is 0.6

Thus, the ACTUAL required number of measurements is as follows:

$$\Delta/\delta = (\text{DCGL}_{\text{REMOVABLE}} - \text{LBGR}_{\text{REMOVABLE}}) / \text{SD}_{\text{REMOVABLE}}$$

$$\Delta/\delta_{\text{transuranics}} = 16.7 = (20 \text{ dpm}/100\text{cm}^2 - 10 \text{ dpm}/100\text{cm}^2) / 0.6 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

$\text{DCGL}_{\text{REMOVABLE}}$ is the removable surface contamination derived concentration guideline value (DOE Order 5400.5 removable surface contamination limit equals 20 dpm/100cm² for transuranics per the B779 Cluster Radiological Closeout Survey Plan)

$\text{LBGR}_{\text{REMOVABLE}}$ is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

$\text{SD}_{\text{REMOVABLE}}$ is the ACTUAL standard deviation of the removable surface contamination measurements

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

Determine the number of removable surface contamination measurements for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium contaminants not being present in the background:

Step 3 Continued

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = 10.9$$

26

Paint Sample Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72901 media sample (paint) data are calculated on the "Survey Area A Building 729 Paint/Solid Media Sample Results" form Because all media sample results are less than DCGL_w (less than 100 dpm/100 cm² for transuranics and 5000 dpm/100 cm² for uranium), the survey unit clearly meets the media sample release criterion

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$ The number of sample points calculated (see "Media Surface Activity Measurement Calculation Worksheet") was based on the use of this test

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w

Step 3

Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Media Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation

The actual media (paint) sample standard deviation for transuranics for 72901 is 15.2
The actual media (paint) sample standard deviation for uranium for 72901 is 11.1

Thus, the ACTUAL required number of samples is as follows

$$\Delta/\delta = (\text{DCGL}_{\text{MEDIA}} - \text{LBGR}_{\text{MEDIA}}) / \text{SD}_{\text{MEDIA}}$$

$$\Delta/\delta_{\text{transuranics}} = 3.28 = (100 \text{ dpm}/100\text{cm}^2 - 50 \text{ dpm}/100\text{cm}^2) / 15.2 \text{ dpm}/100\text{cm}^2$$

$$\Delta/\delta_{\text{uranium}} = 16.2 = (5000 \text{ dpm}/100\text{cm}^2 - 4819.9 \text{ dpm}/100\text{cm}^2) / 11.1 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{MEDIA} is the media sample derived concentration guideline value (DOE Order 5400.5 total surface contamination limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{MEDIA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor *Note that for transuranics, the LBGR was changed from the original value used in calculating the number of measurements (95.7). The original LBGR was chosen only to establish a relative shift between 1 and 3. However, a more reasonable value, and the value recommended by MARSSIM, is one-half of the DCGL_w (or 50 dpm/100 cm²)*

SD_{MEDIA} is the ACTUAL standard deviation of the 72901 samples

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR) The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism)

Determine the number of media samples for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium and Uranium contaminants not being present in the background

Step 3 Continued

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = 10.9$$

Paint Sample Summary Statistics Calculation Worksheet

Where
 1 645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0 998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5 5 2 3

$$N = 10.9 * 1.2 = 13$$

Conclusion Utilizing a conservative relative shift value of 3 0, a minimum of 13 Media (paint) samples was required in 72901

Step 5

Draw conclusions from the data All sample results are less than DCGL_w. The minimum number of required media samples were collected. Thus, survey unit 72901 complies with the media sample release criteria.

Total Surface Activity Posting Plot for Survey Unit 72902

SURVEY UNIT 72902-MAP 1 OF 1

40

72902 TSA Data Frequency Plot

Survey Area: A	Building 729
Survey Unit (s): 72902	

Total Surface Activity Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72902 data are calculated on the "Survey Area A Building 729 Total Surface Contamination Results" form. Because all total surface activity (TSA or TSA) measurement results are less than DCGL_w (less than 100 dpm/100 cm²), the survey unit clearly meets the TSA release criterion.

A graphical data review was also performed on the attached form. The posting plot indicated that spatial trends of elevated areas are not present. The histogram indicated that no isolated areas of elevated activity are present.

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Total Surface Activity Measurement Calculation Worksheet") was based on the use of this test. An average local area background (LAB) value was subtracted from each gross measurement to calculate a net result, thus the sign test applies (sign test is typically applied only when the contaminant is not present in background).

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3

Verify the assumptions of the test The sign test assumes that the data from the survey unit consists of independent samples from each distribution. This assumption is verified per the posting plot (see Step 1), that indicates that spatial dependencies do not exist in the survey unit.

The assumed data variance, as indicated by the assumed standard deviation (see "Total Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation.

The actual sample standard deviation for 72902 is 10.1

Thus, the ACTUAL required number of samples is as follows

$$\Delta/\delta = (DCGL_{TSA} - LBGR_{TSA}) / SD_{TSA}$$

$$\Delta/\delta_{transuranics} = \underline{6.5} = (100 \text{ dpm}/100\text{cm}^2 - 34 \text{ dpm}/100\text{cm}^2) / 10.1 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{TSA} is the total surface activity derived concentration guideline value (DOE Order 5400.5 total surface activity limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium, per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{TSA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

SD_{TSA} is the ACTUAL standard deviation of the total surface activity

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

42

Survey Area: A

Building 729

Survey Unit (s): 72902

Total Surface Activity Summary Statistics Calculation Worksheet

Step 3 Continued

Determine the number of TSA surface activity measurements for the applicable survey unit using the following MARSSIM, Section 5 5 2 3 formula that is based on Plutonium contaminants not being present in the background

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = \underline{10.9}$$

Where

1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5 5 2 3

$$N = \underline{10.9} * 1.2 = \underline{13}$$

Conclusion Utilizing a conservative relative shift value of 3.0, a minimum of 13 Total Surface Activity measurements was required in 72902

Step 5

Draw conclusions from the data All measurements are less than DCGL_w. The minimum number of required measurements were collected. Thus, survey unit 72902 complies with the TSA release criteria

Survey Area: A

Building: 729

Survey Unit (s): 72902

Removable Contamination Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72902 removable surface contamination data are calculated on the "Survey Area A Building 729 Surface Media Survey Results" form Because all removable survey measurement results are less than DCGL_w (less than 20 dpm/100 cm²), the survey unit clearly meets the removable contamination release criterion

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$ The number of sample points calculated (see "Removable Surface Activity Measurement Calculation Worksheet") was based on the use of this test

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w

Step 3

Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Removable Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of smears with the ACTUAL survey unit standard deviation

The actual removable survey standard deviation for 72902 is 0.9

Thus, the ACTUAL required number of measurements is as follows

$$\Delta/\delta = (DCGL_{REMOVABLE} - LBGR_{REMOVABLE}) / SD_{REMOVABLE}$$

$$\Delta/\delta_{transuranics} = \frac{11.1}{0.9} = (20 \text{ dpm}/100\text{cm}^2 - 10 \text{ dpm}/100\text{cm}^2) / 0.9 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{REMOVABLE} is the removable surface contamination derived concentration guideline value (DOE Order 5400.5 removable surface contamination limit equals 20 dpm/100cm² for transuranics per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{REMOVABLE} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

SD_{REMOVABLE} is the ACTUAL standard deviation of the removable surface contamination measurements

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR) The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one The highest published value is utilized for conservatism)

Determine the number of removable surface contamination measurements for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium contaminants not being present in the background

Survey Area: A

Building 729

Survey Unit (s): 72902

Paint Sample Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72902 media sample (paint) data are calculated on the "Survey Area A Building 729 Paint/Solid Media Sample Results" form Because all media sample results are less than DCGL_w (less than 100 dpm/100 cm² for transuranics and 5000 dpm/100 cm² for uranium), the survey unit clearly meets the media sample release criterion

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$ The number of sample points calculated (see "Media Surface Activity Measurement Calculation Worksheet") was based on the use of this test

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w

Step 3

Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Media Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation

The actual media (paint) sample standard deviation for transuranics for 72902 is 0.7
The actual media (paint) sample standard deviation for uranium for 72902 is 10.7

Thus, the ACTUAL required number of samples is as follows

$$\Delta/\delta = (DCGL_{MEDIA} - LBGR_{MEDIA}) / SD_{MEDIA}$$

$$\Delta/\delta_{transuranics} = 71.4 = (100 \text{ dpm}/100\text{cm}^2 - 50 \text{ dpm}/100\text{cm}^2) / 0.7 \text{ dpm}/100\text{cm}^2$$
$$\Delta/\delta_{uranium} = 16.8 = (5000 \text{ dpm}/100\text{cm}^2 - 4819.9 \text{ dpm}/100\text{cm}^2) / 10.7 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{MEDIA} is the media sample derived concentration guideline value (DOE Order 5400.5 total surface contamination limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{MEDIA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor *Note that for transuranics, the LBGR was changed from the original value used in calculating the number of measurements (95.7) The original LBGR was chosen only to establish a relative shift between 1 and 3 However a more reasonable value, and the value recommended by MARSSIM, is one-half of the DCGL_w (or 50 dpm/100 cm²)*

SD_{MEDIA} is the ACTUAL standard deviation of the 72902 samples

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR) The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one The highest published value is utilized for conservatism)

46

Survey Area: A	Building 729
Survey Unit (s): 72902	

Paint Sample Summary Statistics Calculation Worksheet

Step 3 Continued

Determine the number of media samples for the applicable survey unit using the following MARSSIM, Section 5 5 2 3 formula that is based on Plutonium and Uranium contaminants not being present in the background

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = \underline{10.9}$$

Where

1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5 5 2 3

$$N = \underline{10.9} * 1.2 = \underline{13}$$

Conclusion Utilizing a conservative relative shift value of 3.0, a minimum of 13 Media (paint) samples was required in 72902

Step 5

Draw conclusions from the data All sample results are less than DCGL_w. The minimum number of required media samples were collected. Thus, survey unit 72902 complies with the media sample release criteria.

72902 TSA Data Frequency Plot

Survey Area: A

Building 729

Survey Unit (s): 72902

Total Surface Activity Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72902 data are calculated on the "Survey Area A Building 729 Total Surface Contamination Results" form. Because all total surface activity (TSA or TSA) measurement results are less than DCGL_w (less than 100 dpm/100 cm²), the survey unit clearly meets the TSA release criterion.

A graphical data review was also performed on the attached form. The posting plot indicated that spatial trends of elevated areas are not present. The histogram indicated that no isolated areas of elevated activity are present.

Step 2

Select the statistical tests. The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Total Surface Activity Measurement Calculation Worksheet") was based on the use of this test. An average local area background (LAB) value was subtracted from each gross measurement to calculate a net result, thus the sign test applies (sign test is typically applied only when the contaminant is not present in background).

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3

Verify the assumptions of the test. The sign test assumes that the data from the survey unit consists of independent samples from each distribution. This assumption is verified per the posting plot (see Step 1), that indicates that spatial dependencies do not exist in the survey unit.

The assumed data variance, as indicated by the assumed standard deviation (see "Total Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation.

The actual sample standard deviation for 72902 is 10.1

Thus, the ACTUAL required number of samples is as follows:

$$\Delta/\delta = (DCGL_{TSA} - LBGR_{TSA}) / SD_{TSA}$$

$$\Delta/\delta_{transuranics} = \underline{6.5} = (100 \text{ dpm}/100\text{cm}^2 - 34 \text{ dpm}/100\text{cm}^2) / 10.1 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{TSA} is the total surface activity derived concentration guideline value (DOE Order 5400.5 total surface activity limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium, per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{TSA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

SD_{TSA} is the ACTUAL standard deviation of the total surface activity

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

60

Survey Area: A	Building 729
Survey Unit (s): 72902	

Total Surface Activity Summary Statistics Calculation Worksheet

Step 3 Continued

Determine the number of TSA surface activity measurements for the applicable survey unit using the following MARSSIM, Section 5 5 2 3 formula that is based on Plutonium contaminants not being present in the background

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = 10.9$$

Where
 1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan
 Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5 5 2 3
 $N = 10.9 * 1.2 = 13$

Conclusion Utilizing a conservative relative shift value of 3.0, a minimum of 13 Total Surface Activity measurements was required in 72902

Step 5
Draw conclusions from the data All measurements are less than DCGL_w. The minimum number of required measurements were collected. Thus, survey unit 72902 complies with the TSA release criteria.

Survey Area: A	Building 729
Survey Unit (s): 72902	

Removable Contamination Summary Statistics Calculation Worksheet

Step 1
Conduct a preliminary data review (the mean, standard deviation, and median of the 72902 removable surface contamination data are calculated on the "Survey Area A Building 729 Surface Media Survey Results" form. Because all removable survey measurement results are less than DCGL_w (less than 20 dpm/100 cm²), the survey unit clearly meets the removable contamination release criterion.

Step 2
Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Removable Surface Activity Measurement Calculation Worksheet") was based on the use of this test.

 The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3
Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Removable Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of smears with the ACTUAL survey unit standard deviation.

 The actual removable survey standard deviation for 72902 is 0.9

 Thus, the ACTUAL required number of measurements is as follows

$$\Delta/\delta = (DCGL_{REMOVABLE} - LBGR_{REMOVABLE}) / SD_{REMOVABLE}$$

$$\Delta/\delta_{transuranics} = \underline{11.1} = (20 \text{ dpm}/100\text{cm}^2 - 10 \text{ dpm}/100\text{cm}^2) / 0.9 \text{ dpm}/100\text{cm}^2$$
 Where
 Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

 DCGL_{REMOVABLE} is the removable surface contamination derived concentration guideline value (DOE Order 5400.5 removable surface contamination limit equals 20 dpm/100cm² for transuranics per the B779 Cluster Radiological Closeout Survey Plan)

 LBGR_{REMOVABLE} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

 SD_{REMOVABLE} is the ACTUAL standard deviation of the removable surface contamination measurements

 Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

 Determine the number of removable surface contamination measurements for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium contaminants not being present in the background.

62

Survey Area: A	Building 729
Survey Unit (s): 72902	

Removable Contamination Summary Statistics Calculation Worksheet

Step 3 Continued

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = \underline{10.9}$$

Where
 1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological
 Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5.5.2.3
 $N = \underline{10.9} * 1.2 = \underline{13}$

Conclusion Utilizing a conservative relative shift value of 3.0, a minimum of 13 Removable Surface Contamination measurements was required in 72902

Step 5 **Draw conclusions from the data** All measurements are less than DCGL_w. The minimum number of required removable survey measurements were collected. Thus, survey unit 72902 complies with the removable contamination release criteria.

Survey Area: A

Building 729

Survey Unit (s): 72902

Paint Sample Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72902 media sample (paint) data are calculated on the "Survey Area A Building 729 Paint/Solid Media Sample Results" form Because all media sample results are less than DCGL_w (less than 100 dpm/100 cm² for transuranics and 5000 dpm/100 cm² for uranium), the survey unit clearly meets the media sample release criterion

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$ The number of sample points calculated (see "Media Surface Activity Measurement Calculation Worksheet") was based on the use of this test

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w

Step 3

Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Media Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation

The actual media (paint) sample standard deviation for transuranics for 72902 is 0.7
The actual media (paint) sample standard deviation for uranium for 72902 is 10.7

Thus, the ACTUAL required number of samples is as follows

$$\Delta/\delta = (\text{DCGL}_{\text{MEDIA}} - \text{LBGR}_{\text{MEDIA}}) / \text{SD}_{\text{MEDIA}}$$

$$\Delta/\delta_{\text{transuranics}} = 71.4 = (100 \text{ dpm}/100\text{cm}^2 - 50 \text{ dpm}/100\text{cm}^2) / 0.7 \text{ dpm}/100\text{cm}^2$$

$$\Delta/\delta_{\text{uranium}} = 16.8 = (5000 \text{ dpm}/100\text{cm}^2 - 4819.9 \text{ dpm}/100\text{cm}^2) / 10.7 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{MEDIA} is the media sample derived concentration guideline value (DOE Order 5400.5 total surface contamination limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{MEDIA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor Note that for transuranics, the LBGR was changed from the original value used in calculating the number of measurements (95.7) The original LBGR was chosen only to establish a relative shift between 1 and 3 However a more reasonable value, and the value recommended by MARSSIM, is one-half of the DCGL_w (or 50 dpm/100 cm²)

SD_{MEDIA} is the ACTUAL standard deviation of the 72902 samples

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR) The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one The highest published value is utilized for conservatism)

64

Survey Area: A	Building 729
Survey Unit (s): 72902	

Paint Sample Summary Statistics Calculation Worksheet

Step 3 Continued

Determine the number of media samples for the applicable survey unit using the following MARSSIM, Section 5 5 2 3 formula that is based on Plutonium and Uranium contaminants not being present in the background

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = 10.9$$

Where
 1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5 5 2 3

$$N = 10.9 * 1.2 = 13$$

Conclusion Utilizing a conservative relative shift value of 3.0, a minimum of 13 Media (paint) samples was required in 72902

Step 5

Draw conclusions from the data All sample results are less than DCGL_w. The minimum number of required media samples were collected. Thus, survey unit 72902 complies with the media sample release criteria.

SURVEY UNIT 72903-MAP 2 OF 2

17

72903 TSA Data Frequency Plot

Survey Area: A

Building. 729

Survey Unit (s): 72903

Total Surface Activity Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72903 data are calculated on the "Survey Area A Building 729 Total Surface Contamination Results" form. Because all total surface activity (TSA or TSC) measurement results are less than DCGL_w (less than 100 dpm/100 cm²), the survey unit clearly meets the TSA release criterion.

A graphical data review was also performed on the attached form. The posting plot indicated that spatial trends of elevated areas are not present. The histogram indicated that no isolated areas of elevated activity are present.

Step 2

Select the statistical tests. The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Total Surface Activity Measurement Calculation Worksheet") was based on the use of this test. An average local area background (LAB) value was subtracted from each gross measurement to calculate a net result, thus the sign test applies (sign test is typically applied only when the contaminant is not present in background).

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3

Verify the assumptions of the test. The sign test assumes that the data from the survey unit consists of independent samples from each distribution. This assumption is verified per the posting plot (see Step 1), that indicates that spatial dependencies do not exist in the survey unit.

The assumed data variance, as indicated by the assumed standard deviation (see "Total Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation.

The actual sample standard deviation for 72903 is 12.5

Thus, the ACTUAL required number of samples is as follows

$$\Delta/\delta = (DCGL_{TSA} - LBGR_{TSA}) / SD_{TSA}$$

$$\Delta/\delta_{transuranics} = \underline{5.3} = (100 \text{ dpm}/100\text{cm}^2 - 34 \text{ dpm}/100\text{cm}^2) / 12.5 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{TSA} is the total surface activity derived concentration guideline value (DOE Order 5400.5 total surface activity limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium, per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{TSA} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

SD_{TSA} is the ACTUAL standard deviation of the total surface activity

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

79

Survey Area: A	Building 729
Survey Unit (s): 72903	

Total Surface Activity Summary Statistics Calculation Worksheet

Step 3 Continued

Determine the number of TSA surface activity measurements for the applicable survey unit using the following MARSSIM, Section 5 5 2 3 formula that is based on Plutonium contaminants not being present in the background

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = 10.9$$

Where

1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5 5 2 3

$$N = 10.9 * 1.2 = 13$$

Conclusion. Utilizing a conservative relative shift value of 3.0, a minimum of 13 Total Surface Activity measurements was required in 72903

Step 5

Draw conclusions from the data All measurements are less than DCGL_w. The minimum number of required measurements were collected. Thus, survey unit 72903 complies with the TSA release criteria.

	4/24/99
	Date

Survey Area: A	Building: 729
Survey Unit (s): 72903	

Removable Contamination Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72903 removable surface contamination data are calculated on the "Survey Area A Building 729 Surface Media Survey Results" form. Because all removable survey measurement results are less than DCGL_w (less than 20 dpm/100 cm²), the survey unit clearly meets the removable contamination release criterion.

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$. The number of sample points calculated (see "Removable Surface Activity Measurement Calculation Worksheet") was based on the use of this test.

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w. Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w.

Step 3

Verify the assumptions of the test. The assumed data variance, as indicated by the assumed standard deviation (see "Removable Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of smears with the ACTUAL survey unit standard deviation.

The actual removable survey standard deviation for 72903 is 1.1

Thus, the ACTUAL required number of measurements is as follows:

$$\Delta/\delta = (DCGL_{REMOVABLE} - LBGR_{REMOVABLE}) / SD_{REMOVABLE}$$

$$\Delta/\delta_{transuranics} = 9.1 = (20 \text{ dpm}/100\text{cm}^2 - 10 \text{ dpm}/100\text{cm}^2) / 1.1 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{REMOVABLE} is the removable surface contamination derived concentration guideline value (DOE Order 5400.5 removable surface contamination limit equals 20 dpm/100cm² for transuranics per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{REMOVABLE} is the lower bound of the gray region – the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor

SD_{REMOVABLE} is the ACTUAL standard deviation of the removable surface contamination measurements

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR). The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism).

Determine the number of removable surface contamination measurements for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium contaminants not being present in the background.

81

Survey Area: A	Building. 729
Survey Unit (s): 72903	

Removable Contamination Summary Statistics Calculation Worksheet

Step 3 Continued

$$N = (1.645 + 1.645)^2 / 4(\text{Sign P} - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = \underline{10.9}$$

Where
 1.645 is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5.5.2.3

$$N = \underline{10.9} * 1.2 = \underline{13}$$

Conclusion: Utilizing a conservative relative shift value of 3.0, a minimum of 13 Removable Surface Contamination measurements was required in 72903

Step 5

Draw conclusions from the data. All measurements are less than DCGL_w. The minimum number of required removable survey measurements were collected. Thus, survey unit 72903 complies with the removable contamination release criteria.

Building. 729

Survey Unit (s): 72903

Paint Sample Summary Statistics Calculation Worksheet

Step 1

Conduct a preliminary data review (the mean, standard deviation, and median of the 72903 media sample (paint) data are calculated on the "Survey Area A Building 729 Paint/Solid Media Sample Results" form Because all media sample results are less than DCGL_w (less than 100 dpm/100 cm² for transuranics and 5000 dpm/100 cm² for uranium), the survey unit clearly meets the media sample release criterion

Step 2

Select the statistical tests The one-sample sign test was selected to assess the data, with $\alpha = 0.05$ and $\beta = 0.05$ The number of sample points calculated (see "Media Surface Activity Measurement Calculation Worksheet") was based on the use of this test

The performance of the sign test was not necessary due to the fact that each individual net result was less than the DCGL_w Thus, the sign test would result in the rejection of the null hypothesis, and conclude that the median concentration of residual radioactivity in the survey unit is less than the DCGL_w

Step 3

Verify the assumptions of the test The assumed data variance, as indicated by the assumed standard deviation (see "Media Surface Activity Measurement Calculation Worksheet") was verified by re-calculating the required number of samples with the ACTUAL survey unit standard deviation

The actual media (paint) sample standard deviation for transuranics for 72903 is 8.4

The actual media (paint) sample standard deviation for uranium for 72903 is 39.9

Thus, the ACTUAL required number of samples is as follows

$$\Delta/\delta = (DCGL_{MEDIA} - LBGR_{MEDIA}) / SD_{MEDIA}$$

$$\Delta/\delta_{transuranics} = 6.0 = (100 \text{ dpm}/100\text{cm}^2 - 50 \text{ dpm}/100\text{cm}^2) / 8.4 \text{ dpm}/100\text{cm}^2$$

$$\Delta/\delta_{uranium} = 4.5 = (5000 \text{ dpm}/100\text{cm}^2 - 4819.9 \text{ dpm}/100\text{cm}^2) / 39.9 \text{ dpm}/100\text{cm}^2$$

Where

Δ/δ is the relative shift or the resolution of measurements in units of measurement uncertainty

DCGL_{MEDIA} is the media sample derived concentration guideline value (DOE Order 5400.5 total surface contamination limit equals 100 dpm/100cm² for transuranics and 5000 dpm/100cm² for uranium per the B779 Cluster Radiological Closeout Survey Plan)

LBGR_{MEDIA} is the lower bound of the gray region -- the lower bound of the range of values of the parameter of interest in a survey unit where the consequences of making a decision error is relatively minor *Note that for transuranics, the LBGR was changed from the original value used in calculating the number of measurements (95.7). The original LBGR was chosen only to establish a relative shift between 1 and 3. However, a more reasonable value, and the value recommended by MARSSIM, is one-half of the DCGL_w (or 50 dpm/100 cm²)*

SD_{MEDIA} is the ACTUAL standard deviation of the 72903 samples

Determine the Sign P value by looking up the relative shift (Δ/δ) in Table 5.4 of MARSSIM (the Sign P value is the estimated probability that a random measurement from the survey unit will be less than the DCGL when the survey unit median is actually at the LBGR) The Sign P value from Table 5.4, equals 0.998650 for a relative shift of 3.0 (The actual value approaches one. The highest published value is utilized for conservatism)

Determine the number of media samples for the applicable survey unit using the following MARSSIM, Section 5.5.2.3 formula that is based on Plutonium and Uranium contaminants not being present in the background

Survey Area: A

Building: 729

Survey Unit (s): 72903

Paint Sample Summary Statistics Calculation Worksheet

Step 3 Continued

$$N = (1.645 + 1.645)^2 / 4(\text{Sign } P - 0.5)^2$$

$$N = (1.645 + 1.645)^2 / 4(0.998650 - 0.5)^2 = \underline{10.9}$$

Where

1.645

is the alpha and beta decision error value (95% confidence) per the B779 Cluster Radiological Closeout Survey Plan

Sign P

equals 0.998650

Step 4 Increase N by 20% to allow for missing or invalid data points per MARSSIM, Section 5.5.2.3

$$N = \underline{10.9} * 1.2 = \underline{13}$$

Conclusion: Utilizing a conservative relative shift value of 3.0, a minimum of 13 Media (paint) samples was required in 72903

Step 5

Draw conclusions from the data. All sample results are less than DCGL_w. The minimum number of required media samples were collected. Thus, survey unit 72903 complies with the media sample release criteria.

SCM/SIMS Surface Contamination Survey Results and Maps

Introduction

Survey 72901001 was conducted on April 2, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901001 ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 137 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

5	2	8	122	0	20 0	80
6	2	5	95	0	18 0	32

Table 1 The X and Y columns reference the grids of Figures 1 and 2. **Bold text** denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria
100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits
DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72901002 was conducted on April 3, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901002 ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 135 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

Table 1 The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

104

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1 m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1 m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72901006 was conducted on April 3, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901006 ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 137 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72901014 was conducted on April 3, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901014 ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 103 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

11	1	0	0	0	0	16

Table 1 The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

137

Introduction

Survey 72901015 was conducted on April 3, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 72901015 ranged from 0 to 69 dpm/pixel. 100 cm^2 data ranged from 0 to 69 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

2	2	12	61	0	12 0	35
3	2	7	61	0	17 0	63

Table 1 The X and Y columns reference the grids of Figures 1 and 2. **Bold text** denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

161

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72901025 was conducted on April 6, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901025 ranged from 0 to 137 dpm/pixel. 100 cm² data ranged from 0 to 192 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729011n ranged from 0 to 198 dpm/pixel. 100 cm² data ranged from 0 to 224 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

189

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729011nu was conducted on March 22, 1999 by PILKINGTON/STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 729011nu ranged from 0 to 117 dpm/pixel. 100 cm^2 data ranged from 0 to 137 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm^2 data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm^2 areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

214

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729012n was conducted on March 19, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729012n ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 133 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

218

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

219

Introduction

Survey 729012s was conducted on March 19, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 729012s ranged from 0 to 122 dpm/pixel. 100 cm^2 data ranged from 0 to 171 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm^2 data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm^2 areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

222

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729012w was conducted on March 19, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729012w ranged from 0 to 137 dpm/pixel. 100 cm² data ranged from 0 to 164 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

19	11	0	0	0	0	4

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 7290121F was conducted on March 18, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 25%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 7290121F ranged from 0 to 169 dpm/pixel. 100 cm² data ranged from 0 to 255 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

Table 1 The X and Y columns reference the grids of Figures 1 and 2 **Bold text denotes grids which exceed the applicable DCGL** When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data All units (i.e mean, max, min and standard deviation) are in dpm/100cm².

260

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729015n was conducted on February 26, 1999 by CHETE as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM1. The Position Sensitive Proportional Counter was operating with an efficiency of 39%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 729015n ranged from 0 to 77 dpm/pixel. 100 cm^2 data ranged from 0 to 154 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm^2 data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm^2 areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

274

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 7290152w was conducted on March 26, 1999 by PILKINGTON/STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 7290152w ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 171 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

Table 1 The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 7290154f was conducted on March 26, 1999 by PILKINGTON/STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 7290154f ranged from 0 to 116 dpm/pixel. 100 cm² data ranged from 0 to 184 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}

Introduction

Survey 729016f was conducted on March 23, 1999 by PILKINGTON/STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729016f ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 137 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

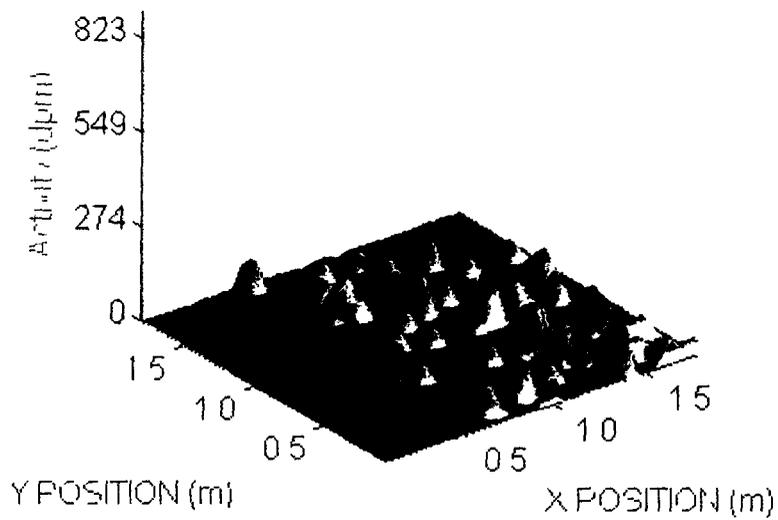

Figure 1 Image plot of surface activity showing 25 cm² pixels The vertical scale is in dpm per pixel

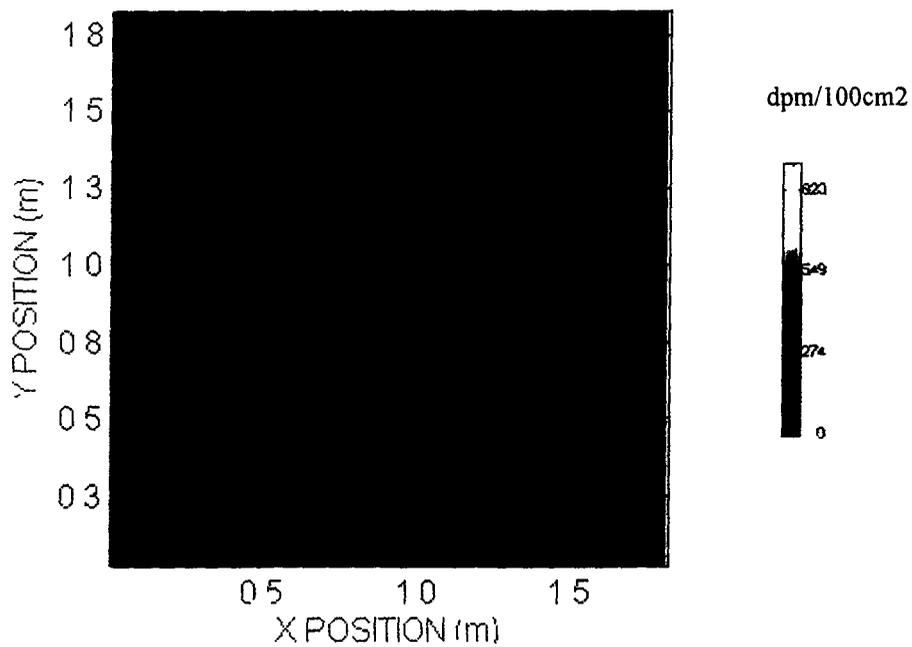

Figure 2 Meter grid overlaid onto image plot of 25 cm² pixels The color scale is in dpm per 100cm²

306

X	Y	Mean	Max	Min	STD	100cm² Areas
1	1	6	85	0	14 0	40
2	1	17	137	0	25 0	80
1	2	6	102	0	13 0	32
2	2	7	68	0	16 0	64

Table 1 The X and Y columns reference the grids of Figures 1 and 2. **Bold text** denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729016fc was conducted on March 17, 1999 by STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM1. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729016fc ranged from 0 to 128 dpm/pixel. 100 cm² data ranged from 0 to 171 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM1, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729018fc was conducted on March 17, 1999 by SMITH as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729018fc ranged from 0 to 86 dpm/pixel. 100 cm² data ranged from 0 to 129 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

Introduction

Survey 729019ff was conducted on February 26, 1999 by CHETE as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM1. The Position Sensitive Proportional Counter was operating with an efficiency of 39%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 729019ff ranged from 0 to 154 dpm/pixel. 100 cm^2 data ranged from 0 to 218 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm^2 data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm^2 areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}

Introduction

Survey 72901300 was conducted on April 1, 1999 by PILKINGTON/STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 25%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901300 ranged from 0 to 218 dpm/pixel. 100 cm² data ranged from 0 to 310 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

9	2	20	219	0	42 0	80
10	2	19	218	0	31 0	80

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

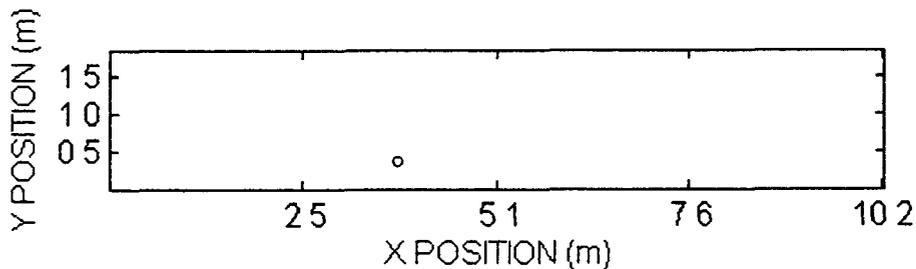

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

354

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72901603 was conducted on March 29, 1999 by PILKINGTON/STANLEY as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 39%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72901603 ranged from 0 to 15 dpm/pixel. 100 cm² data ranged from 0 to 31 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729027ww was conducted on March 22, 1999 by PILKINGTON/STANLEY as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729027ww ranged from 0 to 69 dpm/pixel. 100 cm² data ranged from 0 to 171 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

384

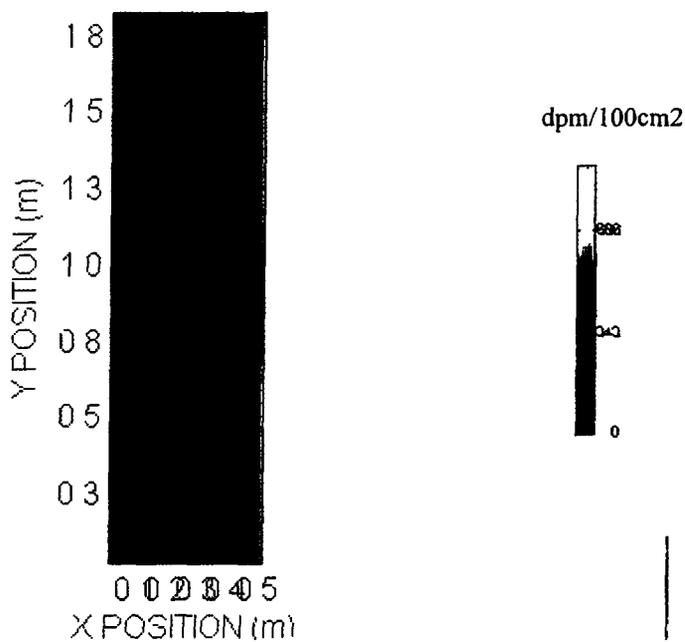

Figure 2 Meter grid overlaid onto image plot of 25 cm² pixels The color scale is in dpm per 100cm².

385

X	Y	Mean	Max	Min	STD	100cm² Areas
1	1	13	102	0	24 0	50
1	2	17	171	0	35 0	40

Table 1 The X and Y columns reference the grids of Figures 1 and 2. **Bold text denotes grids which exceed the applicable DCGL.** When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

386

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729028f was conducted on March 22, 1999 by PILKINGTON/STANLEY as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. Table 1 The X and Y columns reference the grids of Figures 1 and 2. **Bold text denotes grids which exceed the applicable DCGL.** When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

418

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1 m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1 m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72902302 was conducted on March 31, 1999 by PILKINGTON/STANLEY as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 25%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72902302 ranged from 0 to 170 dpm/pixel. 100 cm² data ranged from 0 to 251 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

1	1	13	309	0	33.0	100
2	1	14	194	0	36.0	70
1	2	24	222	0	43.0	80
2	2	11	199	0	35.0	56

Table 1 The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

450

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

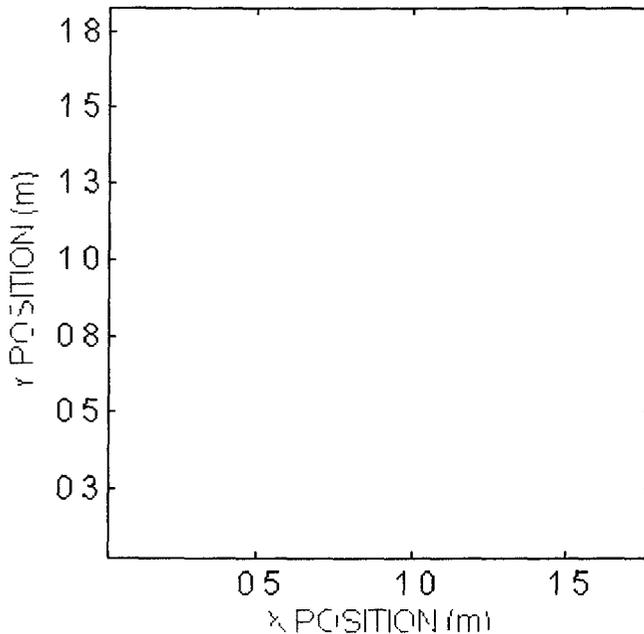

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

Introduction

Survey 72902306 was conducted on March 31, 1999 by PILKINGTON/STANLEY as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 25%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 72902306 ranged from 0 to 210 dpm/pixel. 100 cm^2 data ranged from 0 to 210 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm^2 data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm^2 areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

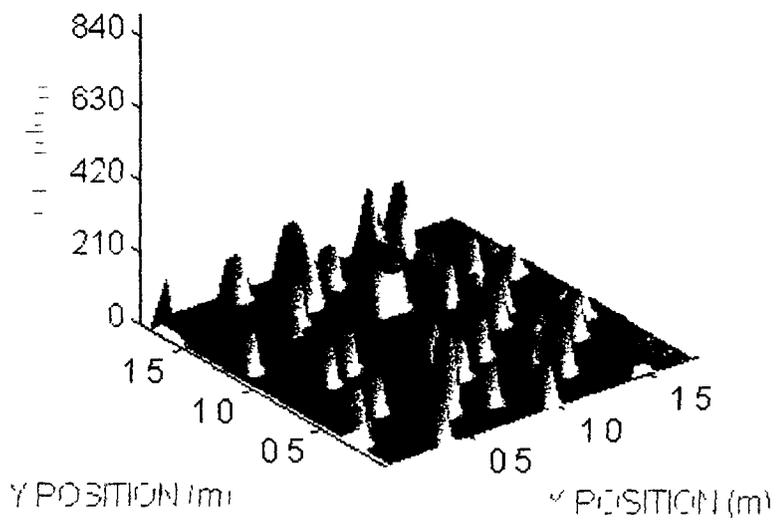

Figure 1 Image plot of surface activity showing 25 cm² pixels. The vertical scale is in dpm per pixel.

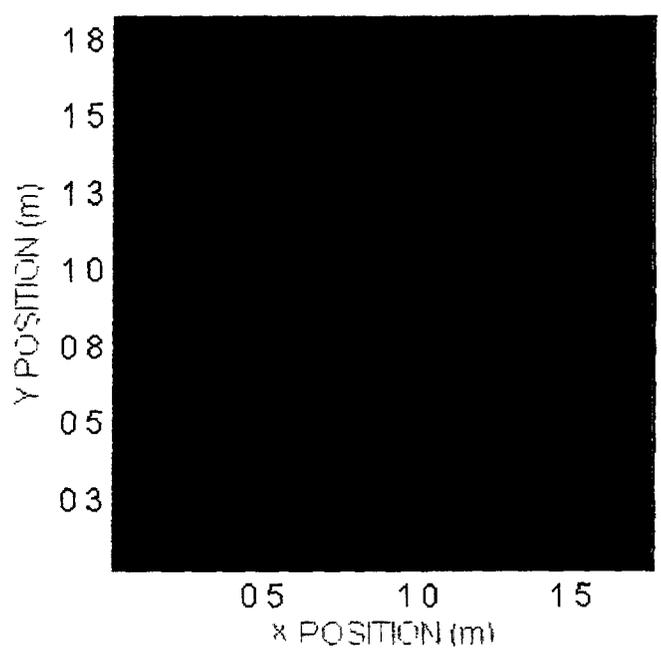

Figure 2 Meter grid overlaid onto image plot of 25 cm² pixels. The color scale is in dpm per 100cm²

453

X	Y	Mean	Max	Min	STD	100cm² Areas
1	1	12	210	0	36 0	100
2	1	14	105	0	32 0	70
1	2	15	203	0	44 0	80
2	2	22	204	0	40 0	56

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

454

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 72903001 was conducted on April 5, 1999 by OLSEN as part of the 72903 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 72903001 ranged from 0 to 206 dpm/pixel. 100 cm² data ranged from 0 to 274 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400 5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}

Introduction

Survey 729031w was conducted on March 3, 1999 by CHETE as part of the 72903 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729031w ranged from 0 to 129 dpm/pixel. 100 cm² data ranged from 0 to 214 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

487

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}

Introduction

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_W = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_W.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

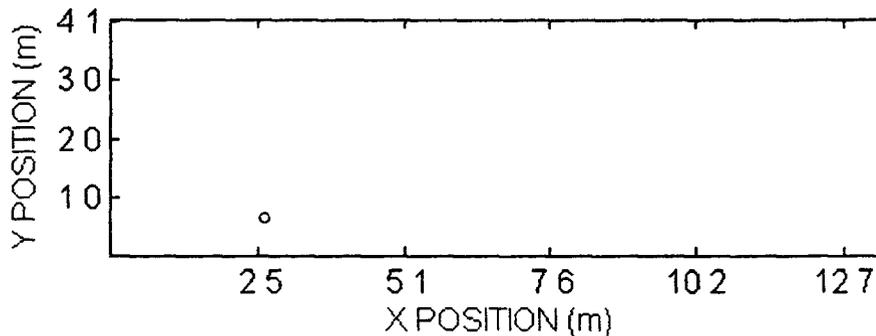

Figure 3. Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}.

Introduction

Survey 729032sb was conducted on March 8, 1999 by CHETE as part of the 72903 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729032sb ranged from 0 to 129 dpm/pixel. 100 cm² data ranged from 0 to 300 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

Table 1 The X and Y columns reference the grids of Figures 1 and 2. **Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².**

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were above the DCGL_{EMC}. Figure 3 details which zones were above the DCGL_{EMC}.

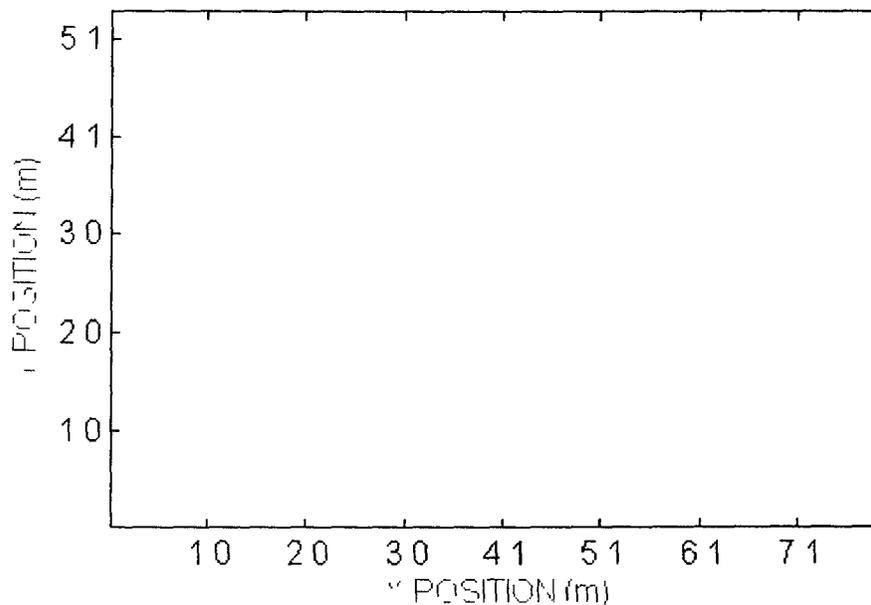

Figure 3 Yellow pixels correspond to the upper left coordinate of a 100cm² area exceeding the DCGL_{EMC}

Introduction

Survey 729035u was conducted on March 15, 1999 by OLSEN as part of the 72903 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729035u ranged from 0 to 129 dpm/pixel. 100 cm² data ranged from 0 to 257 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

196

X	Y	Mean	Max	Min	STD	100cm² Areas
1	1	13	130	0	23 0	100
2	1	12	137	0	23 0	100
1	2	10	102	0	19 0	80
2	2	13	171	0	23 0	80

Table 1 The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

197

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729011tc was conducted on March 17, 1999 by SMITH as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm^2 areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm^2 areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm^2 sums are offset by 25 cm^2 pixels, thus ensuring that all possible 100 cm^2 combinations of the data are considered.

Total measured activity for 729011tc ranged from 0 to 171 dpm/pixel. 100 cm^2 data ranged from 0 to 379 dpm/ 100 cm^2 . An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm^2 data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm^2 areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

222

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

223

Introduction

Survey 729012w was conducted on March 19, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729012w ranged from 0 to 137 dpm/pixel. 100 cm² data ranged from 0 to 164 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

Table 1 The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

226

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

227

Introduction

Survey 7290120p was conducted on March 17, 1999 by SMITH as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 35%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 7290120p ranged from 0 to 113 dpm/pixel. 100 cm² data ranged from 0 to 241 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

Table 1. The X and Y columns reference the grids of Figures 1 and 2. Bold text denotes grids which exceed the applicable DCGL. When "100" is indicated in the "100cm² Areas", then the grid is a full square meter. The mean is the average of all measurements in the grid, and is compared to the DCGL_w. The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria
100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits
DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 7290121F was conducted on March 18, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 25%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 7290121F ranged from 0 to 169 dpm/pixel. 100 cm² data ranged from 0 to 255 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

The max is compared to the DCGL_{EMC}. The standard deviation is calculated from pixels that contain data. All units (i.e. mean, max, min and standard deviation) are in dpm/100cm².

238

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 7290121F was conducted on March 18, 1999 by OLSEN as part of the 72901 survey. Data was gathered using SRA Surface Contamination Monitor, SCM2. The Position Sensitive Proportional Counter was operating with an efficiency of 25%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 7290121F ranged from 0 to 148 dpm/pixel. 100 cm² data ranged from 0 to 239 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed DCGLs.

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM2, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria

100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits

DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729013s was conducted on February 26, 1999 by CHETE as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCM1. The Position Sensitive Proportional Counter was operating with an efficiency of 39%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729013s ranged from 0 to 77 dpm/pixel. 100 cm² data ranged from 0 to 167 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid. Table 1 also reports the number of 100 cm² areas containing data for each grid. Figure 2 shows the grid pattern. Bold text denotes grids which exceed either DCGL.

COMPARISON OF RESULTS WITH GUIDELINES

The survey data provided by the SRA Surface Contamination Monitor, serial number SCM1, was compared to the following criteria. The DCGLs were calculated by adding an observed background of 0 dpm/100 cm² to the survey criteria.

DOE Order 5400.5 Criteria
100 dpm/100 cm², averaged over 1m²
300 dpm/100 cm², maximum in 100 cm²

Total Activity Limits
DCGL_w = 100 dpm/100 cm², averaged over 1m²
DCGL_{EMC} = 300 dpm/100 cm², maximum in 100 cm²

The survey results indicate that surface activity levels averaged over one square meter were below the DCGL_w.

The survey results indicate that the maximum surface activity levels in the 100 square centimeter zones were below the DCGL_{EMC}.

Introduction

Survey 729014e was conducted on February 26, 1999 by CHETE as part of the 72902 survey. Data was gathered using SRA Surface Contamination Monitor, SCMI. The Position Sensitive Proportional Counter was operating with an efficiency of 39%. The SRA Survey Information Management System was used to provide visual imaging and analysis of the survey data and to generate this report.

Surface Activity Levels

The SCM measures and records activity in 25 cm² areas called pixels. Each square meter contains 400 individual pixels. These pixels are summed into 100 cm² areas for comparison to the DCGLs. To evaluate the measured activity levels against the DCGLs, consecutive 100 cm² sums are offset by 25 cm² pixels, thus ensuring that all possible 100 cm² combinations of the data are considered.

Total measured activity for 729014e ranged from 0 to 115 dpm/pixel. 100 cm² data ranged from 0 to 154 dpm/100 cm². An interpolated surface plot of the data is provided in Figure 1. A light source is simulated to add definition via shadows to the artifacts in the image.

Square Meter Data

Conventional statistics are provided by SIMS. The survey is divided into meter grids. Table 1 reports the 100 cm² data for mean, min, max, and standard deviation for each grid.
