EXECUTIVE SUMMARY

A Pre-Demolition Survey (PDS) was performed to enable compliant disposition and waste management of Building 879. Because this Type 2 facility will be decommissioned, the characterization was performed in accordance with the Pre-Demolition Survey Plan (MAN-127-PDSP) to supplement the Reconnaissance Level Characterization of this Type 2 facility. Building surfaces characterized as part of this PDS included the floor, walls, ceiling and roof. Environmental media beneath and surrounding the facility was not within the scope of this PDS and will be addressed using the Soil Disturbance Permit process and in compliance with Rocky Flats Cleanup Agreement (RFCA).

This PDS encompassed both radiological and chemical characterization to enable the compliant disposition and waste management pursuant to the D&D Characterization Protocol (MAN-077-DDCP). The characterization built upon physical, chemical and radiological hazards identified in the facility-specific Historical Site Assessment Report and Reconnaissance Level Characterization Report (RLCR).

PDS results indicate that radiological contaminates exist in excess of the Pre-Demolition Survey Plan (PDSP) unrestricted release limits. Surfaces within the Building 879 plenum could not be decontaminated below the PDSP radiological unrestricted release limits without compromising the structural integrity of the building, or were too difficult to decontaminate. Therefore, the plenum side of the structure will be removed and managed as low level radiological waste (LLW) during demolition. The fan room side of the structure met PDSP unrestricted release limits and will be removed and managed as sanitary waste during demolition.

There is no beryllium or hazardous waste in excess of the PDSP unrestricted release limits. However, fixatives were used to immobilize beryllium contamination. All PCB ballasts and hazardous waste items (e.g., mercury thermostats, fluorescent light bulbs, mercury vapor light bulbs, mercury-containing gauges, circuit boards, leaded glass, and lead-acid batteries) have been removed and disposed of in compliance with Environmental Protection Agency (EPA) and Colorado Department of Public Health and Environment (CDPHE) regulations. Asbestos abatement was not required in Building 879 since all in-process asbestos sample results were non-detect. PCBs (polychlorinated biphenyls) in paint meet the unrestricted release criteria of the RSOP for Facility Disposition (specific to 40CFR 761.62c).

Based upon this PDSR, Building 879 can be demolished and the waste managed as LLW and sanitary waste as applicable. To ensure the facility remains free of further contamination and PDS data remain valid, Level 2 Isolation Controls have been established and the areas posted accordingly.

1 INTRODUCTION

A Pre-Demolition Survey (PDS) was performed to enable compliant disposition and waste management of Building 879. Because this Type 2 facility will be decommissioned, the characterization was performed in accordance with the Pre-Demolition Survey Plan (MAN-127-PDSP) to supplement the Reconnaissance Level Characterization of this Type 2 facility. Building surfaces characterized as a part of this PDS included floor, walls, ceiling and roof. Environmental media beneath and surrounding the facility was not within the scope of this PDS and will be addressed using the Soil Disturbance Permit process and in compliance with RFCA.

As part of the Rocky Flats Environmental Technology Site (RFETS) Closure Project, numerous facilities will be removed, among these is Building 879. The location of this facility is shown in Attachment A, *Facility Location Map*. This facility no longer supports the RFETS mission and will be decommissioned to reduce Site infrastructure, risks and/or operating costs.

Before this Type 2 facility can be decommissioned, the Data Quality Objectives (DQOs) for a Pre-Demolition Survey (PDS) must be satisfied; this document presents the PDS results for Building 879. The PDS was conducted pursuant to the Decontamination and Decommissioning Characterization Protocol (MAN-077-DDCP) and the Pre-Demolition Survey Plan for D&D Facilities (MAN-127-PDSP). The PDS is built upon physical, chemical and radiological hazards identified in the facility-specific Historical Site Assessment Report, Reconnaissance Level Characterization Report, and in-process survey and sample data.

1.1 Purpose

The purpose of this report is to communicate and document the results of the Building 879 PDS effort. A PDS is performed prior to building demolition to define the final radiological and chemical conditions of a facility. Final conditions are compared with the release limits for radiological and non-radiological contaminants. PDS results will enable project personnel to make final disposition decisions, develop related worker health and safety controls, and estimate waste volumes by waste types.

1.2 Scope

This report presents the final radiological and chemical conditions of Building 879. Environmental media beneath and surrounding the facility is not within the scope of this PDSR and will be addressed using the Soil Disturbance Permit process and in compliance with RFCA.

6

1.3 Data Quality Objectives

The Data Quality Objectives (DQOs) used in designing this PDS were the same DQOs identified in the Pre-Demolition Survey Plan for D&D Facilities (MAN-127-PDSP), with the exception of the plenum radiological surveys. Refer to section 2.0 of MAN-127-PDSP for these DQOs. The plenum radiological survey Data Quality Objectives (DQOs) were met by following Radiological Safety Practice procedures 3-PRO-165-07.02, *Contamination Monitoring Requirements*, and PRO-267-RSP-09.05, *Radiological Characterization for Surface Contaminated Objects.*

2 HISTORICAL SITE ASSESSMENT

A Facility-specific Historical Site Assessment (HSA) and a Reconnaissance Level Characterization (RLC) was conducted to understand the facility history and related hazards. The HSA consisted of facility walk-downs, interviews, and document review, including review of the Historical Release Report, and were used to design the RLC. The RLC for Building 879 was performed in FY 2001 as part of the Building 883 Cluster RLCR (refer to *Reconnaissance Level Characterization Report For The Building 883 Cluster,* dated July 2001). Based on the RLC results, Building 879 was classified as a Type 2 facility, therefore, PDS characterization was required before decommissioning of the facility. The HSA, RLC and in-process results were used to identify PDS data gaps and needs, and to develop radiological and chemical PDS characterization packages. The RLCR showed radiological contamination inside Building 879. The HSA and RLC documentation are located in the RISS Characterization Project files.

3 RADIOLOGICAL CHARACTERIZATION AND HAZARDS

Radiological contamination was identified during the RLC, as well as, during the in-process stripout and decontamination phases in Building 879. Thus, stripout and decontamination was required prior to the PDS. All potentially contaminated equipment and system piping were removed from the building prior to PDS. Fixed radiological contamination could not be decontaminated below the PDS unrestricted release criteria without compromising the structural integrity of the building or was too difficult to decontaminate. Radiological contamination was embedded into the structure such that if the decontamination effort chased the contamination into the cracks and joints, the structural integrity of the facility would be compromised to the point of being unsafe for human occupancy. Therefore, the plenum portion of the building will be removed and managed as LLW during demolition. Plenum surfaces were decontaminated in order to remove as much removable contamination as practical, and then fixatives were applied to immobilize any remaining loose contamination. The plenum was then re-surveyed for waste disposal and LLW demolition planning purposes.

No removable radiological or beryllium contamination existed above the unrestricted release criteria after fixative application. Appropriate controls will be incorporated into the demolition work packages to control these hazards during demolition. The plenum in-process radiological waste disposal and LLW demolition planning surveys are contained in Attachment B-1, *In-Process Radiological Survey Forms.* The following bullets summarize the results of the in-process surveys:

7

- Interior plenum surfaces

  Pre-fixative: 150,000 dpm/100cm^2 fixed, 10,000 dpm/100cm^2 loose

  Post-fixative: <150,000 dpm/100cm^2 fixed, <1,000 dpm/100cm^2 loose

The Fan Room portion of Building 879 was characterized for radiological hazards per the PDSP. Radiological characterization was performed to define the nature and extent of radioactive materials that may be present on the Fan Room surfaces. Measurements were performed to evaluate the contaminants of concern. Based upon a review of historical and process knowledge, building walk-downs, and MARSSIM guidance, a Radiological Characterization Plan was developed during the planning phase that describes the minimum survey requirements (refer to the RISS Characterization Project files).

Radiological survey unit package 879001 was developed for all the Fan Room surfaces. The survey package was developed in accordance with Radiological Safety Practices (RSP) 16.01, *Radiological Survey/Sampling Package Design, Preparation, Control, Implementation and Closure*. Total surface activity (TSA), removable surface activity (RSA), and scan measurements were collected in accordance with RSP 16.02 *Radiological Surveys of Surfaces and Structures*. Radiological survey data were verified, validated and evaluated in accordance with RSP 16.04, *Radiological Survey/Sample Data Analysis*. Quality control measures were implemented relative to the survey process in accordance with RSP 16.05, *Radiological Survey/Sample Quality Control*.

Twenty seven (27) TSA measurements (15 random, 10 biased and 2 QC) and twenty (25) RSA measurements (15 random and 10 biased) were performed; and a minimum 10% of the Fan Room surfaces were scanned. The PDS data confirmed that the Fan Room surfaces do not contain radiological contamination above the surface contamination guidelines provided in the PDSP. Fan Room radiological survey data, statistical analysis results, and survey locations are presented in Attachment B-2, *Fan Room Radiological Data Summary and Survey Maps*. The radiological survey unit package is maintained in the RISS Characterization Project files. Level 2 Isolation Control postings are displayed on the facility to ensure no radioactive materials are inadvertently introduced.

Building 879 exterior was surveyed per PDS requirements as part of the *Reconnaissance Level Characterization Report for the Building 883 Cluster,* dated July 2001, and met PDS unrestricted release levels. Additional random confirmatory swipe surveys of wall and roof surfaces of the Building 879 exterior were performed during the PDS survey, and all results were less than the PDS unrestricted release levels. Refer to Attachment B-3, *879 Confirmatory Exterior Survey* for the building exterior confirmatory radiological survey.

4 CHEMICAL CHARACTERIZATION AND HAZARDS

Building 879 was characterized for chemical hazards per the PDSP. Chemical characterization was performed to determine the nature and extent of chemical contamination that may be present on, or in the facility. Based upon a review of historical and process knowledge, visual inspections, and PDSP DQOs, additional sampling needs were determined. A Chemical Characterization Plan was developed during the planning phase that describes sampling requirements and the justification for the sample locations and estimated sample numbers. The contaminants of concern were asbestos, beryllium, and RCRA constituents. Isolation control postings are displayed at building entrances to ensure no hazardous materials are introduced.

4.1 Asbestos

A survey of building materials suspected of containing asbestos was conducted during in-process stripout of the facility. A CDPHE-certified asbestos inspector conducted the inspections and sampling in accordance with the *Asbestos Characterization Protocol, PRO-563-ACPR, Revision 1.* Building materials suspected of containing asbestos were identified for sampling at the discretion of the inspector. All in process asbestos samples were non-detect, therefore, asbestos abatement was not required in Building 879 and no further asbestos sampling was performed as part of this PDS.

4.2 Beryllium (Be)

During the in-process stripout and decontamination phase of the Building 879 project, all areas containing loose beryllium contamination were decontaminated to below the unrestricted release limit of 0.2 $\mu g/100cm^2$. The use of fixatives was necessary to decontaminate some areas below the unrestricted release limit. Levels up to 0.665 $\mu g/100cm^2$ were immobilized using fixative. Since Building 879 was on the list of Known Beryllium Areas, both random and biased PDS sampling was required. Once the plenum was isolated from Building 883, random and biased beryllium PDS swipes were collected and analyzed.

Random and biased beryllium smear samples were collected in Building 879 in accordance with the PDSP and the *Beryllium Characterization Procedure,* PRO-536-BCPR, Revision 0, September 9, 1999. The table in Attachment C summarizes the PDS beryllium swipe data for Building 879. All final "as left" beryllium PDS swipe results were less than the action levels of 0.2 $\mu g/100cm^2$ and investigative levels of 0.1 $\mu g/100cm^2$. Detailed PDS beryllium laboratory swipe data and location maps are contained in Attachment C, *Chemical Data Summaries and Sample Maps.*

4.3 RCRA/CERCLA Constituents [including metals and volatile organic compounds (VOCs)

Based on a review of the HSAR, RLCR, interviews and facility walk-downs, Building 879 functioned as the HEPA Filter Ventilation Plenum building for Building 883. Although RCRA/CERCLA products were used in the facility, there is no evidence of RCRA/CERCLA contamination. Also, the filter plenum that directly served machining equipment in Building 865 was sampled and determined to be free of RCRA/CERCLA constituents. On this basis, it is very unlikely that Building 879 (a general building filter plenum) became contaminated with RCRA/CERCLA constituents. Therefore, sampling was not performed as part of this PDSR.

The facility contained some RCRA regulated items, such as mercury thermostats, fluorescent light bulbs, mercury vapor light bulbs, mercury containing gauges, circuit boards, and lead-acid batteries. However, these items have been removed and managed in accordance with the Colorado Hazardous Waste Act.

Sampling for lead in paint in this facility was not performed. Environmental Waste Compliance Guidance #27, *Lead-based Paint (LBP) and Lead-based paint Debris Disposal*, states that LBP debris generated outside of currently identified high contamination areas shall be managed as non-hazardous (solid) wastes, and additional analysis for characteristics of hazardous waste derived from LBP is not a requirement for disposal.

4.4 Polychlorinated Biphenyls (PCBs)

Based on a review of the HSAR and facility walk-downs, there is no history of PCB use or evidence of PCB contamination in this facility. On this basis, no PCB sampling was performed. Based on the age of Building 879 (constructed before 1980), paints used are assumed to contain PCBs, and painted surfaces will be managed as PCB Bulk Product Waste. The facility may have contained PCB fluorescent light ballasts, however, all leaking PCB ballasts, and those greater than 9 pounds have been removed from the facility and managed appropriately.

5 PHYSICAL HAZARDS

Physical hazards associated with Building 879 are those common to standard industrial environments, and include hazards associated with energized systems, utilities, and trips and falls. There are no other unique hazards associated with the facility. The facility has been relatively well maintained and is in good physical condition, therefore, does not present hazards associated with building deterioration. Physical hazards are controlled by the Site Occupational Safety and Industrial Hygiene Program, which is based on OSHA regulations, DOE orders, and standard industry practices.

6 DATA QUALITY ASSESSMENT

Data used in making management decisions for the decommissioning of Building 879, and consequent waste management, are of adequate quality to support the decisions documented in this report. The data presented in this report (Attachments B and C) were verified and validated relative to DOE quality requirements, applicable EPA guidance, and original project DQOs.

In summary, the Verification and Validation (V&V) process corroborates that the following elements of the characterization process are adequate:

- the *number* of samples and surveys;
- the *types* of samples and surveys;
- the sampling/survey process as implemented "in the field"; and
- the laboratory analytical process, relative to accuracy and precision considerations.

Details of the DQA are provided in Attachment D.

7 DECOMMISSIONING WASTE TYPES AND VOLUME ESTIMATES

The decommissioning of the plenum portion of Building 879 will generate LLW and will be removed and sent to an offsite LLW landfill. The decommissioning of the Fan Room of Building 879 will generate sanitary waste and will be removed and sent to an offsite sanitary waste landfill. Estimated waste types and volumes are presented below. All ballasts and hazardous waste items have been removed and managed pursuant to Site PCB and waste management procedures.

WASTE TYPES AND VOLUME ESTIMATES

Facility	Concrete (cu ft)	Wood (cu ft)	Metal (cu ft)	Corrugated Sheet Metal (cu ft)	Wall Board (cu ft)	ACM (cu ft)	Other Waste (cu ft)
879	3,000 – sanitary	0	1,300 – LLW 1,000 - sanitary	950 – sanitary	0	0	Roofing buildup - 400 sanitary Insulation - 1,300 sanitary

8 FACILITY CLASSIFICATION AND CONCLUSIONS

Based on the analysis of radiological, chemical and physical hazards, Building 879 is ready for demolition. PDS results indicate that radiological contaminates exist in excess of the PDSP unrestricted release limits. Surfaces within the Building 879 plenum could not be decontaminated below the PDSP radiological unrestricted release limits without compromising the structural integrity of the building, or were too difficult to decontaminate. Therefore, the plenum side of the structure will be removed and managed as low level radiological waste (LLW) during demolition. The fan room side of the structure met PDSP unrestricted release limits and will be removed and managed as sanitary waste during demolition.

Building 879 does not possess beryllium or chemical contamination in excess of the PDSP unrestricted release limits. However, fixatives were used to immobilize beryllium contamination. All PCB ballasts and hazardous waste items (e.g., mercury thermostats, fluorescent light bulbs, mercury vapor light bulbs, mercury-containing gauges, circuit boards, leaded glass, and lead-acid batteries) have been removed and disposed of in compliance with Environmental Protection Agency (EPA) and Colorado Department of Public Health and Environment (CDPHE) regulations. In process asbestos sampling was conducted and all asbestos samples were non-detect, therefore, asbestos abatement was not required in Building 879 and no further asbestos sampling was performed as part of this PDS.

The PDS for Building 879 was performed in accordance with the DDCP and PDSP, all PDSP DQOs were met, and all data satisfied the PDSP DQA criteria, with the exception of the plenum radiological surveys. The plenum radiological survey Data Quality Objectives (DQOs) were met by following Radiological Safety Practice procedures 3-PRO-165-07.02, *Contamination Monitoring Requirements*, and PRO-267-RSP-09.05, *Radiological Characterization for Surface Contaminated Objects*. Environmental media beneath and surrounding the facility will be addressed at a future date using the Soil Disturbance Permit process and in compliance with RFCA. To ensure Building 879 remains free of further contamination and PDS data remain valid, Level 2 Isolation Controls have been established and the facility posted accordingly.

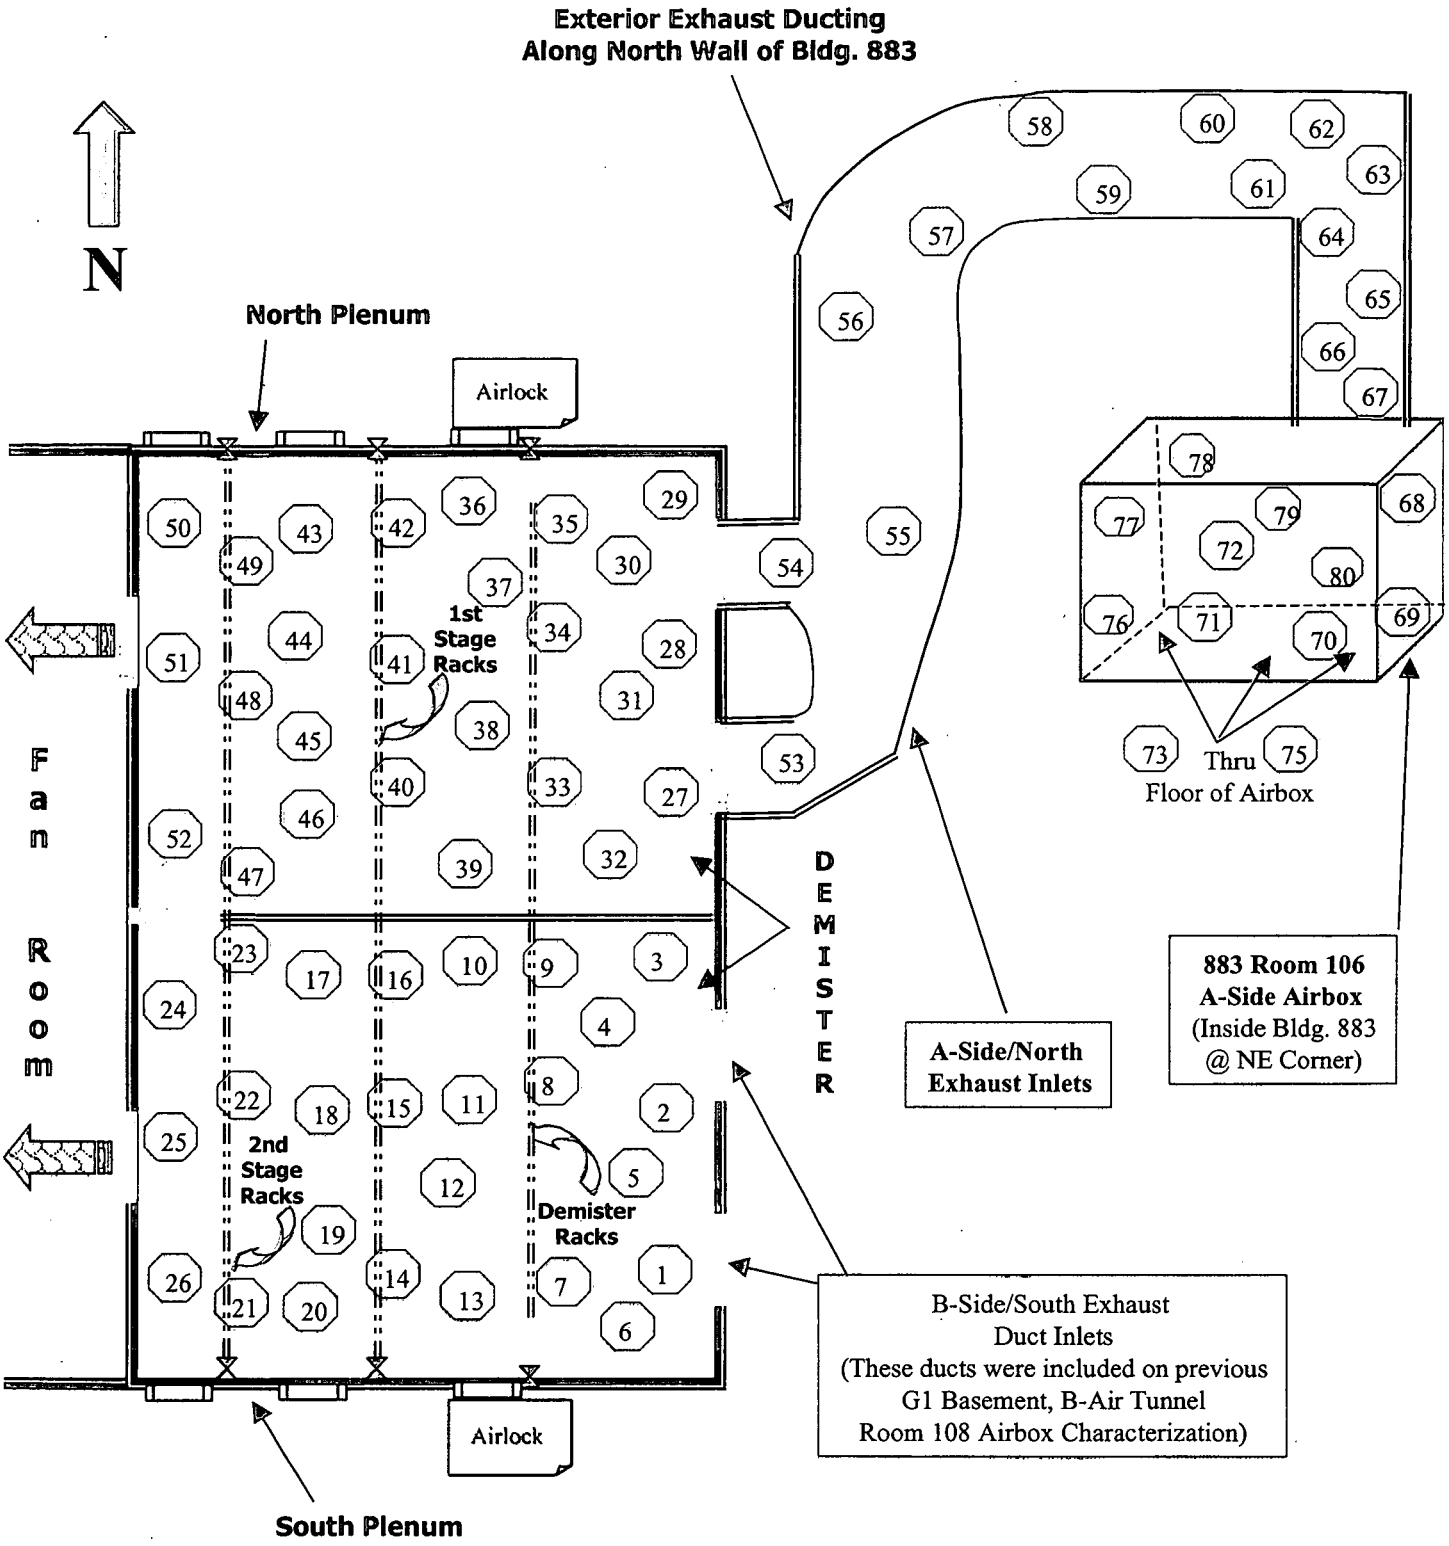
Statistical Summary	Beta Accessible Removable dpm/100cm^2	Beta Accessible Fixed dpm/100cm^2
Maximum	10,000	150,000
Mean (Average)	3,097	16,160
n	80	80
Standard Deviation	3,032	26,646

RE Comments	
G. M. Aldrich, X7175	Readings were taken after pressure-washing inside Bldg. 879 Plenum, North Duct and Airbox. Refer to the map for approximate survey locations. Readings were generally "biased", and reflect highest levels seen around the location. Italicised readings were at MDA.

Bldg. 879 Plenum & North Exhaust Internals
Post Pressure Wash Characterization Map



Swipe & direct surveys taken at approximate locations shown. See the attached Contamination Data Summary sheets for activity levels seen and components surveyed. Airlock removable levels were < MDA.

Conclusion - A comparison of the random, biased and QC measurement results against the PDSP Table 7-1 Surface Contamination Guideline limits was conducted; the comparison demonstrates that this survey unit passes the criterion specified in the PDSP.

Survey Area: 1 **Survey Unit:** 879001 **Building:** 879

Description: Building 879 Interior, Floor, Walls and Ceiling

Footnotes:

Building 879 Beryllium Sample Results Table

(1) Shaded rows are beryllium results prior to the application of fixative or final decon. The unshaded rows are the final "as left" condition sample results.
Further decon or fixative was applied over all elevated locations as well as extending to the boundaries of clean sample locations surrounding the elevated locations.
All initial sample locations above 0.1 ug/100cm2 were either further deconned or had fixative applied and were then re-sampled.
Additonal biased post-fixative or post-decon samples were collected in the same general area of the initial elevated sample locations.
All final post-decon or post-fixative swipes were less than the 0.2 ug/100 cm2 beryllium limit and no further investigation sampling is required.
(2) Gaps in the sample numbering sequence are acceptable. Some sample numbers were never used and some were used more than once.
Some sample numbers were elevated, then decontaminated, and then resampled using the same initial sample number.

Data Quality Assurance Detail

DATA QUALITY ASSESSMENT (DQA)

VERIFICATION & VALIDATION (V&V) OF RESULTS

V&V of the data confirm that appropriate quality controls are implemented throughout the sampling and analysis process, and that any substandard controls result in qualification or rejection of the data in question. The required quality controls and their implementation are summarized in a tabular, checklist format for each category of data – radiological surveys and chemical analyses (specifically beryllium).

DQA criteria and results are provided in a tabular format for each suite of surveys or chemical analyses performed. The radiological survey assessment is provided in Table D-1 and beryllium in Table D-2. A data completeness summary for all results is given in Table D-3. The plenum radiological survey Data Quality Objectives (DQOs) were satisfied per Radiological Safety Practice procedures 3-PRO-165-07.02, *Contamination Monitoring Requirements*, and PRO-267-RSP-09.05, *Radiological Characterization for Surface Contaminated Objects*.

All relevant Quality records supporting this report are maintained in the RISS Characterization Project File. The report will be submitted to the CERCLA Administrative Record for permanent storage within 30 days of approval by the Regulators. The Fan Room radiological data is organized into a Survey Package, which correlates to a unique (MARSSIM) Survey Unit. For the 879 Plenum in-process surveys were performed. Chemical data are organized by RIN (Report Identification Number) and are traceable to the sample number and corresponding sample location.

Survey designs were implemented for Building 879 based on the uranium limits (DCGLs) in the unrestricted release decision process. Fan Room survey results were evaluated against, and were less than the Uranium $DCGL_w$ (5,000 dpm/100cm^2) unrestricted release limits. Since the Plenum could not be decontaminated below the PDSP unrestricted release DCGLs, no formal PDS survey designs and sampling was performed. Instead in-process waste disposal and LLW demolition planning surveys were performed. As a result, the in-process waste disposal and LLW demolition planning surveys suffice as the PDS surveys for the Plenum, and are contained in Attachment B-1, *In-Process Radiological Survey Forms*. Additionally, the requirements of EPA's G-4 DQO process regarding radiological survey design and number of surveys required is not applicable to the plenum as the surveys were in-process.

43

DQA SUMMARY

In summary, the data presented in this report have been verified and validated relative to the quality requirements and project decisions as stated in the original DQOs. All data are useable based on the qualifications stated herein and are considered satisfactory without qualification. All media surveyed yielded results less than their associated action levels and with acceptable certainties except for the Plenum radiological surveys as summarized in Section 3. On this basis, Building 879 plenum will be managed and disposed of as LLW during demolition, and the Building 879 Fan Room will be managed and disposed of as sanitary waste during demolition. Appropriate controls will be incorporated into the demolition work packages to control the LLW hazards during demolition.

In addition, the use of fixatives was necessary to decontaminate some areas below the PDS unrestricted release limits for Beryllium. Levels up to 0.665 $\mu g/100cm^2$ were identified (pre fixative) during in process sampling and were immobilized using fixative. Once the plenum was isolated from Building 883, random and biased beryllium PDS swipes were collected and analyzed. All final "as left" (post fixative) beryllium PDS swipe results were less than the action levels of 0.2 $\mu g/100cm^2$ and investigative levels of 0.1 $\mu g/100cm^2$. The table in Attachment C summarizes the PDS beryllium swipe data for Building 879. Detailed PDS beryllium laboratory swipe data and location maps are contained in Attachment C, *Chemical Data Summaries and Sample Maps.*

No removable radiological or beryllium contamination existed above the unrestricted release criteria in these areas after fixative application. Minimum survey requirements were met, sampling/survey protocol was performed in accordance with applicable procedures, and instrument performance and calibrations were within acceptable limits. Chain of Custody was intact; documentation was complete, hold times were acceptable (where applicable,) and packaging integrity/custody seals were maintained throughout the sampling/analysis process. Level 2 Isolation Controls have been posted to prevent further inadvertent introduction of contamination into Building 879. On this basis, Building 879 is ready for demolition.

Table D-1 V&V of Radiological Results - Buildings 879

V&V CRITERIA, RADIOLGICAL SURVEYS		K-H RSP 16.00 Series MARSSIM (NUREG-1575)		
QUALITY REQUIREMENTS				
	Parameters	**Measure**	**Frequency**	**COMMENTS**
ACCURACY	Initial calibrations	90%<x<110%	≥1	Multi-point calibration through the measurement range encountered in the field; programmatic records.
	Daily source checks	80%<x<120%	≥1/day	Performed daily/within range.
	Local area background: Field	Typically < 10 dpm	≥1/day	All local area backgrounds were within expected ranges (i.e., no elevated anomalies.)
PRECISION	Field duplicate measurements for TSA	≥5% of real survey points	≥10% of reals	N/A
REPRESENTATIVENESS	MARSSIM methodology: Survey Unit 879001 (interior).	Statistical and biased	NA	Random w/ statistical confidence.
	Survey Maps	NA	NA	Random and biased measurement locations controlled/mapped to ±1m.
	Controlling Documents (Characterization Pkg; RSPs)	Qualitative	NA	Refer to the Characterization Package (planning document) for field/sampling procedures (located in Project files); thorough documentation of the planning, sampling/analysis process, and data reduction into formats.
COMPARABILITY	Units of measure	dpm/100cm^2	NA	Use of standardized engineering units in the reporting of measurement results.
COMPLETENESS	Plan vs. Actual surveys Usable results vs. unusable	>95% >95%	NA	See Table D-3 for details.
SENSITIVITY	Detection limits	(Uranium) TSA: ≤2,500 dpm/100cm^2 RSA: ≤500 dpm/100cm^2	all measures	PDS MDAs ≤ 50% $DCGL_w$

Table D-2 V&V of Beryllium Results - Building 879

V&V CRITERIA, CHEMICAL ANALYSES		DATA PACKAGE		
BERYLLIUM	Prep: NMAM 7300 METHOD: OSHA ID-125G	LAB --->	Johns Manville Littleton, Colorado	
		RIN ---->	RINS: 05D0296, 05D0298, 05Z0306, 05D0326	
QUALITY REQUIREMENTS		Measure	Frequency	COMMENTS
ACCURACY	Calibrations Initial	Linear calibration	≥1	All final "as left" Beryllium PDS results were below unrestricted release levels.
	Continuing	80%<%R<120%	≥1	
	LCS/MS	80%<%R<120%	≥1	
	Blanks – lab & field	<MDL	≥1	
	Interference check std (ICP)	NA	NA	
PRECISION	LCSD	80%<%R<120% (RPD<20%)	≥1	
	Field duplicate	All results < RL	≥1	
REPRESENTATIVENESS	COC	Qualitative	NA	
	Hold times/preservation	Qualitative	NA	
	Controlling Documents (Plans, Procedures, maps, etc.)	Qualitative	NA	
COMPARABILITY	Measurement units	Ug/100cm^2	NA	
COMPLETENESS	Plan vs. Actual samples Usable results vs. unusable	>95% >95%	NA	
SENSITIVITY	Detection limits	MDL of 0.00084 ug/swipe	all measures	

Table D-3 Data Completeness Summary – Building 879

ANALYTE	Building/Area/Unit	Sample Number Planned (Real & QC)[A]	Sample Number Taken (Real & QC)	Project Decisions (Conclusions) & Uncertainty	Comments (RIN, Analytical Method, Qualifications, etc.)
Beryllium	Building 879 Fan Room (interior)	15 samples (10 random/5 biased)	18 samples (10 random/8 biased)	Beryllium contamination identified above associated action levels prior to fixative All final "as left" results were less than associated action levels	10CFR850; OSHA ID-125G Pre Fixative: RIN05D0296, RIN05D0298 and RIN05Z0306 Post Fixative: RIN05D0326 Beryllium contamination identified during in process sampling greater than the PDS unrestricted release levels (pre fixative). However, all final "as left" beryllium results (post fixative) were less than the associated action level (0.2ug/100cm^2) or investigative level (0.1 ug/100cm^2) after fixative was applied. Refer to Section 3 and Attachment D, DQA, for further discussion.
Beryllium	Building 879 Plenum (interior)	19 samples (13 random/5 biased)	50 samples (13 random/37 biased)	Beryllium contamination identified above associated action levels prior to fixative All final "as left" results were less than associated action levels	10CFR850; OSHA ID-125G Pre Fixative: RIN05D0296, RIN05D0298 and RIN05Z0306 Post Fixative: RIN05D0326 Beryllium contamination identified during in process sampling greater than the PDS unrestricted release levels (pre fixative). However, all final "as left" beryllium results (post fixative) were less than the associated action level (0.2ug/100cm^2) or investigative level (0.1 ug/100cm^2) after fixative was applied. Refer to Section 3 and Attachment D, DQA, for further discussion.

Table D-3 Data Completeness Summary – Building 879

ANALYTE	Building/Area/Unit	Sample Number Planned (Real & QC)[A]	Sample Number Taken (Real & QC)	Project Decisions (Conclusions) & Uncertainty	Comments (RIN, Analytical Method, Qualifications, etc.)
Radiological	Survey Unit: 879001 Building 879 Fan Room – Floor, Walls and Ceilings (interior)	25 β TSA (15 random/10 biased) 25 β Smears (15 random/10 biased) 2 QC TSA 10% scan	25 β TSA (15 random/10 biased) 25 β Smears (15 random/10 biased) 2 QC TSA 10% scan	No contamination at any location; all values below unrestricted release levels	Uranium DCGLs used.
Radiological	Building 879 Plenum – Floor, Walls and Ceilings (interior)	0 samples All surveys were In-Process, no survey units were developed	80 β TSA 92 β Smears	[1]Contamination identified greater than the Uranium unrestricted release limits	Uranium DCGLs used. [1]Refer to Section 3 for a detailed discussion regarding elevated results.
