Sampling Event Summary

Site: Shiprock, New Mexico, Disposal Site

Sampling Period: September 26–29, 2016

Groundwater and surface water sampling and analyses are performed semiannually at the Shiprock, New Mexico, Disposal Site. Terrace locations are monitored to determine the progress of remediation and the extent of contamination. Floodplain locations are monitored to determine the progress of the natural flushing process. Planned monitoring locations are shown in Attachment 1, Sampling and Analysis Work Order.

Sampling and analyses were conducted as specified in the Sampling and Analysis Plan for U.S. Department of Energy Office of Legacy Management Sites (LMS/PRO/S04351, continually updated, http://energy.gov/lm/downloads/sampling-and-analysis-plan-us-department-energy-office-legacy-management-sites). Samples were submitted for analyses identified by a requisition index number (RIN). Samples from floodplain locations were submitted under RIN 16098030 and from terrace locations under RIN 16098031. An assessment of anomalous data is included in Attachment 4.

Water levels were measured in all sampled wells and in 11 additional wells. See Attachment 2, Trip Report for additional details.

As identified in the Final Ground Water Compliance Action Plan for Remediation at the Shiprock, New Mexico, UMTRA Site (July 2002), the contaminants of concern monitored at the Shiprock disposal site are ammonium, manganese, nitrate, selenium, strontium, sulfate, and uranium. Time-concentration graphs (2005 to present, where available) for the contaminants of concern in floodplain wells are included in Attachment 3, Data Presentation. Water quality parameters calcium, chloride, magnesium, potassium, and sodium are also monitored as stated in the plan. Because of the analytical methodologies employed, ammonium and nitrate data collected since 2004 are reported as “Ammonia Total as N” and “Nitrate + Nitrite as N.” These are conservative estimates for the true ammonium and nitrate concentrations because both ammonia and ammonium are included in the Ammonia Total as N analysis and both nitrate and nitrite are included in the Nitrate + Nitrite as N analysis. Floodplain wells with contaminant concentrations that exceeded compliance standards and cleanup goals presented in the plan are listed in Table 1.

<sup>a</sup> Compliance standards (uranium, nitrate, selenium) and cleanup goals (manganese, sulfate) are listed in the Final Ground Water Compliance Action Plan (GCAP) for Remediation at the Shiprock, New Mexico, UMTRA Site (July 2002), approved by the U.S. Nuclear Regulatory Commission.

<sup>b</sup> 10 mg/L of Nitrate-N is equivalent to 44 mg/L of Nitrate (GCAP Table 3-1).

mg/L = milligrams per liter

Both filtered and unfiltered samples from the river locations were submitted. River location analyte concentrations of filtered and unfiltered samples were compared to the maximum concentrations previously observed for location 0967, which is upstream from the site on the San Juan River and is used for background versus site comparisons. With the exception of Ammonia Total as N in the filtered sample for location 0965, all results were below the historical maximums.

Laboratory Performance Assessment

General Information

Report Number (RIN): 16098030  
Sample Event: September 26–29, 2016  
Site(s): Shiprock Disposal Site (Floodplain), New Mexico  
Laboratory: ALS Laboratory Group, Fort Collins, Colorado  
Work Order No.: 1610026  
Analysis: Metals and Wet Chemistry  
Validator: Gretchen Baer  
Review Date: November 29, 2016

This validation was performed according to the “Standard Practice for Validation of Environmental Data” found in Appendix A of the Sampling and Analysis Plan for U.S. Department of Energy Office of Legacy Management Sites (LMS/PRO/S04351, continually updated, http://energy.gov/lm/downloads/sampling-and-analysis-plan-us-department-energy-office-legacy-management-sites). The procedure was applied at Level 3, Data Validation.

This validation includes the evaluation of data quality indicators (DQIs) associated with the data. DQIs are the quantitative and qualitative descriptors that are used to interpret the degree of acceptability or utility of data. Indicators of data quality include the analysis of laboratory control samples to assess accuracy; duplicates and replicates to assess precision; and interference check samples to assess bias (see Figure 1 through Figure 3, Data Validation Worksheets). The DQIs comparability, completeness, and sensitivity are also evaluated in the sections to follow.

All analyses were successfully completed. The samples were prepared and analyzed using accepted procedures based on methods specified by line item code, which are listed in Table 4.

### Sample Shipping/Receiving

ALS Laboratory Group in Fort Collins, Colorado, received 82 water samples on October 4, 2016, accompanied by Chain of Custody forms. Copies of the air bills were included in the receiving documentation. The Chain of Custody forms were checked to confirm that all of the samples were listed and that signatures and dates were present indicating sample relinquishment and receipt. The sample submittal documents including the Chain of Custody forms had no errors or omissions.

### Preservation and Holding Times

The sample shipments were received intact with the temperatures inside the iced coolers at 2.3 °C and 2.4 °C, which complies with requirements. All samples were received in the correct container types and had been preserved correctly for the requested analyses. All samples were analyzed within the applicable holding times.

### Detection and Quantitation Limits

A method detection limit (MDL) is defined in 40 CFR 136 as the minimum concentration of an analyte that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The MDLs reported by the laboratory were compared to the required MDLs to assess the sensitivity of the analyses and found to be in compliance with contractual requirements.

The practical quantitation limit (PQL) for an analyte, defined as 5 times the MDL, is the lowest concentration that can be quantitatively measured, and is used when evaluating laboratory method performance in the sections below.
Laboratory Instrument Calibration

Method requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the analytes of interest. Initial Calibration Verification (ICV) demonstrates that the instrument is capable of acceptable performance at the beginning of the analytical run. Continuing Calibration Verification (CCV) demonstrates that the initial calibration is still valid by checking the performance of the instrument on a continuing basis. Initial and continuing calibration standards must be prepared from independent sources to ensure the validity of the calibration. All laboratory instrument calibrations and calibration verifications were performed correctly in accordance with the cited methods.

Method EPA 350.1
Calibrations were performed for ammonia as N on October 18–20, 2016, using six calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria.

Method EPA 353.2
Calibrations were performed for nitrate + nitrite as N on October 21, 2016, using seven calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria.

Method SW-846 6010B
Calibrations for calcium, magnesium, manganese, potassium, sodium, and strontium were performed October 19 and 20, 2016, using three calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria. Reporting limit verification checks were made at the required frequency to verify the linearity of the calibration curve near the PQL and all results were within the acceptance range.

Method SW-846 6020A
Calibrations for selenium and uranium were performed October 26, 2016, using four calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria. Reporting limit verification checks were made at the required frequency to verify the linearity of the calibration curve near the PQL. Mass calibration and resolution verifications were performed at the beginning of each analytical run in accordance with the analytical procedure. Internal standard recoveries associated with requested analytes were stable and within acceptable ranges.
Method SW-846 9056
Calibrations were performed for chloride and sulfate on October 3, 2016, using five calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria.

Method and Calibration Blanks
Method blanks are analyzed to assess any contamination that may have occurred during sample preparation. Calibration blanks are analyzed to assess instrument contamination prior to and during sample analysis. All method blank and calibration blank results associated with the samples were below the PQLs for all analytes. In cases where the blank concentration exceeds the MDL, associated sample results that are greater than the MDL but less than 5 times the blank concentration are qualified with a “U” flag as not detected.

Inductively Coupled Plasma Interference Check Sample Analysis
Interference check samples are analyzed to verify the instrumental interelement and background correction factors and assess any bias due to interelement interferences. Interference check samples were analyzed at the required frequency with all results meeting the acceptance criteria.

Matrix Spike Analysis
Matrix spikes are aliquots of environmental samples to which a known concentration of an analyte has been added before analysis. Matrix spike and matrix-spike duplicate (MS/MSD) analysis is used to assess the performance of the method by measuring the effects of interferences caused by the sample matrix and reflects the bias of the method for the particular matrix in question.

The MS/MSD data are not evaluated when the concentration of the unspiked sample is greater than 4 times the spike concentration. The spikes met the recovery and precision criteria for all analytes.

Laboratory Replicate Analysis
Laboratory replicate analyses are used to determine laboratory precision for each sample matrix. The relative percent difference for replicate results that are greater than 5 times the PQL should be less than 20%. For results that are less than 5 times the PQL, the range should be no greater than the PQL. All replicate results met these criteria, demonstrating acceptable precision.

Laboratory Control Samples
Laboratory control samples (LCSs) were analyzed at the correct frequency to provide information on the accuracy of the analytical method and the overall laboratory performance, including sample preparation. The LCS results were acceptable for all analyses.
Metals Serial Dilution

Serial dilutions were prepared and analyzed for the metals analyses to monitor chemical or physical interferences in the sample matrix. Serial dilution data are evaluated when the concentration of the undiluted sample is greater than 50 times the MDL. All evaluated serial dilution data were acceptable.

Completeness

Results were reported in the correct units for all analytes requested using contract-required laboratory qualifiers.

Chromatography Peak Integration

The integration of analyte peaks was reviewed for all chloride and sulfate data. All peak integrations were satisfactory.

Anion/Cation Balance

Environmental water should be electrically neutral. Expressed in milliequivalents per liter (meq/L), the sum of the anions should equal the sum of the cations. The anion/cation balance is calculated as the difference between the anions and cations, divided by the sum of the anions and cations. The anion/cation balance can be used to identify potential errors in the analytical results. Typically, a charge balance of less than 10% is considered acceptable. When a charge balance is greater than 10%, the associated data are closely examined for error. If no errors are found, the results are considered to be acceptable. Table 6 shows the total anion and cation results from this event and the charge balance.

All charge balances were below 10%.

Electronic Data Deliverable (EDD) File

A revised EDD file arrived on November 2, 2016. The revision included corrections to some uranium results. The Sample Management System EDD validation module was used to verify that the EDD file was complete and in compliance with requirements. The module compares the contents of the file to the requested analyses to ensure all and only the requested data are delivered. The contents of the EDD were manually examined to verify that the sample results accurately reflect the data contained in the sample data package.

Figure 3 (continued). Wet Chemistry Validation Worksheet, RIN 16098030
General Information

Report Number (RIN): 16098031
Sample Event: September 26–29, 2016
Site(s): Shiprock Disposal Site (Terrace), New Mexico
Laboratory: ALS Laboratory Group, Fort Collins, Colorado
Work Order No.: 1610031
Analysis: Metals and Wet Chemistry
Validator: Gretchen Baer
Review Date: December 2, 2016

This validation was performed according to the “Standard Practice for Validation of Environmental Data” found in Appendix A of the Sampling and Analysis Plan for U.S. Department of Energy Office of Legacy Management Sites (LMS/PRO/S04351, continually updated, http://energy.gov/lm/downloads/sampling-and-analysis-plan-us-department-energy-office-legacy-management-sites). The procedure was applied at Level 3, Data Validation.

This validation includes the evaluation of data quality indicators (DQIs) associated with the data. DQIs are the quantitative and qualitative descriptors that are used to interpret the degree of acceptability or utility of data. Indicators of data quality include the analysis of laboratory control samples to assess accuracy; duplicates and replicates to assess precision; and interference check samples to assess bias (see Figure 4 through Figure 6, Data Validation Worksheets). The DQIs comparability, completeness, and sensitivity are also evaluated in the sections to follow.

All analyses were successfully completed. The samples were prepared and analyzed using accepted procedures based on methods specified by line item code, which are listed in Table 7.

**Sample Shipping/Receiving**

ALS Laboratory Group in Fort Collins, Colorado, received 62 water samples on September 29 and October 4, 2016, accompanied by Chain of Custody forms. Copies of the air bills were included in the receiving documentation. The Chain of Custody forms were checked to confirm that all of the samples were listed and that signatures and dates were present indicating sample relinquishment and receipt. The sample submittal documents including the Chain of Custody forms had no errors or omissions, with the following exception. A full bottle set could not be collected at location 1011, but the Chain of Custody erroneously listed the bottles that were not collected.

**Preservation and Holding Times**

The sample shipments were received intact with the temperatures inside the iced coolers between 1.8 °C and 3.5 °C, which complies with requirements. All samples were received in the correct container types and had been preserved correctly for the requested analyses. All samples were analyzed within the applicable holding times.

**Detection and Quantitation Limits**

A method detection limit (MDL) is defined in 40 CFR 136 as the minimum concentration of an analyte that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The MDLs reported by the laboratory were compared to the required MDLs to assess the sensitivity of the analyses and found to be in compliance with contractual requirements.

The practical quantitation limit (PQL) for an analyte, defined as 5 times the MDL, is the lowest concentration that can be quantitatively measured, and is used when evaluating laboratory method performance in the sections below.

**Laboratory Instrument Calibration**

Method requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for the analytes of interest. Initial Calibration Verification (ICV) demonstrates that the instrument is capable of
acceptable performance at the beginning of the analytical run. Continuing Calibration Verification (CCV) demonstrates that the initial calibration is still valid by checking the performance of the instrument on a continuing basis. Initial and continuing calibration standards must be prepared from independent sources to ensure the validity of the calibration. All laboratory instrument calibrations and calibration verifications were performed correctly in accordance with the cited methods.

**Method MCAWW 160.1**
There are no initial or continuing calibration requirements associated with the determination of Total Dissolved Solids (TDS).

**Method EPA 350.1**
Calibrations were performed for ammonia as N on October 20 and 24, 2016, using six calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks associated with reported results met the acceptance criteria.

**Method EPA 353.2**
Calibrations were performed for nitrate + nitrite as N October 21, 2016, using seven calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria.

**Method SW-846 6010B**
Calibrations for calcium, magnesium, manganese, potassium, sodium, and strontium were performed October 18 and 19, 2016, using three calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria. Reporting limit verification checks were made at the required frequency to verify the linearity of the calibration curve near the PQL and all results were within the acceptance range.

**Method SW-846 6020A**
Calibrations for selenium and uranium were performed October 26 and 31, 2016, using four calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria. Reporting limit verification checks were made at the required frequency to verify the linearity of the calibration curve near the PQL. Mass calibration and resolution verifications were performed at the beginning of each analytical run in accordance with the analytical procedure. Internal standard recoveries associated with requested analytes were stable and within acceptable ranges.

**Method SW-846 9056**
Calibrations were performed for chloride and sulfate on October 3, 2016, using five calibration standards. The calibration curve correlation coefficient values were greater than 0.995 and the
absolute values of the intercepts were less than 3 times the MDL as required by the cited method. The ICV and CCV checks were made at the required frequency. All calibration checks met the acceptance criteria.

Method and Calibration Blanks

Method blanks are analyzed to assess any contamination that may have occurred during sample preparation. Calibration blanks are analyzed to assess instrument contamination prior to and during sample analysis. All method blank and calibration blank results associated with the samples were below the PQLs for all analytes. In cases where the blank concentration exceeds the MDL, associated sample results that are greater than the MDL but less than 5 times the blank concentration are qualified with a “U” flag as not detected.

Inductively Coupled Plasma Interference Check Sample Analysis

Interference check samples are analyzed to verify the instrumental interelement and background correction factors and assess any bias due to interelement interferences. Interference check samples were analyzed at the required frequency with all results meeting the acceptance criteria.

Matrix Spike Analysis

Matrix spikes are aliquots of environmental samples to which a known concentration of an analyte has been added before analysis. Matrix spike and matrix-spike duplicate (MS/MSD) analysis is used to assess the performance of the method by measuring the effects of interferences caused by the sample matrix and reflects the bias of the method for the particular matrix in question.

The MS/MSD data are not evaluated when the concentration of the unspiked sample is greater than 4 times the spike concentration. The spikes met the recovery and precision criteria for all analytes.

Laboratory Replicate Analysis

Laboratory replicate analyses are used to determine laboratory precision for each sample matrix. The relative percent difference for replicate results that are greater than 5 times the PQL should be less than 20%. For results that are less than 5 times the PQL, the range should be no greater than the PQL. All replicate results met these criteria, demonstrating acceptable precision.

Laboratory Control Samples

Laboratory control samples (LCSs) were analyzed at the correct frequency to provide information on the accuracy of the analytical method and the overall laboratory performance, including sample preparation. The LCS results were acceptable for all analyses.

Metals Serial Dilution

Serial dilutions were prepared and analyzed for the metals analyses to monitor chemical or physical interferences in the sample matrix. Serial dilution data are evaluated when the
concentration of the undiluted sample is greater than 50 times the MDL. Evaluated serial dilution data were acceptable with the exception of some dilution results for selenium. The associated results are qualified with a “J” flag as estimated values.

Completeness

Results were reported in the correct units for all analytes requested using contract-required laboratory qualifiers.

Chromatography Peak Integration

The integration of analyte peaks was reviewed for all chloride and sulfate data. All peak integrations were satisfactory.

Anion/Cation Balance

Environmental water should be electrically neutral. Expressed in milliequivalents per liter (meq/L), the sum of the anions should equal the sum of the cations. The anion/cation balance is calculated as the difference between the anions and cations, divided by the sum of the anions and cations. The anion/cation balance can be used to identify potential errors in the analytical results. Typically, a charge balance of less than 10% is considered acceptable. When a charge balance is greater than 10%, the associated data are closely examined for error. If no errors are found, the results are considered to be acceptable. Table 9 shows the total anion and cation results from this event and the charge balance.

</table>

Locations 0600, 0602, 0822, 0889, 1093R, and 1221 had charge balances greater than 10%. There were no analytical errors identified during the review of the laboratory data. All other
charge balances were below 10%. The anion/cation balance cannot be calculated for location 1011; the anions sample could not be collected at this location because the well went dry during sampling.

**Electronic Data Deliverable (EDD) File**

A revised EDD file arrived on December 15, 2016, in response to Request for Information #16-5553. The revision included corrections to some sodium results. The Sample Management System EDD validation module was used to verify that the EDD file was complete and in compliance with requirements. The module compares the contents of the file to the requested analyses to ensure all and only the requested data are delivered. The contents of the EDD were manually examined to verify that the sample results accurately reflect the data contained in the sample data package. Although not requested, lead results (reported in µg/L) for location SHP02 1215 were included in the EDD file; this is acceptable and no correction or data qualification is necessary.
SAMPLE MANAGEMENT SYSTEM
General Data Validation Report

RIN: 16098031   Lab Code: PAR   Validator: Gretchen Baer   Validation Date: 11/28/2016
Project: Shiprock Monitoring   Analysis Type: ☑ Metals   ☑ General Chem   ☐ Rad  ☐ Organics
# of Samples: 62   Matrix: WATER   Requested Analysis Completed: Yes

Chain of Custody
Present: OK Signed: OK Dated: OK
Sample
Integrity: OK Preservation: OK Temperature: OK

Select Quality Parameters
☑ Holding Times
☑ Detection Limits
☐ Field/Trip Blanks
☑ Field Duplicates

All analytes were completed within the applicable holding times.
The reported detection limits are equal to or below contract requirements.
There were 4 duplicates evaluated.

**Figure 6 (continued). Wet Chemistry Validation Worksheet, RIN 16098031**
Sampling Quality Control Assessment

The following information summarizes and assesses quality control for this sampling event.

Sampling Protocol

Sample results for monitoring wells that met the Category I, II, or III low-flow sampling criteria were qualified with an “F” flag in the database, indicating the wells were purged and sampled using the low-flow sampling method.

Floodplain wells 0773 and 0797, and terrace wells 0600, 0602, 0604, 0814, 0817, 0819, 0820, 0822, 0824, 0825, 0826, 0827, 0828, 0832, 1007, 1011, 1058, 1059, 1068, 1073, 1074, and MW1 were classified as Category II or III. The sample results for these wells were further qualified with a “Q” flag, indicating the data are qualitative because of the sampling technique.

A filtered sample and a non-filtered sample were collected at San Juan River locations 0501, 0897, 0899, 0940, 0956, 0965, 0967, 1203, and 1205. Only non-filtered samples were collected at all other surface water locations as per the Shiprock program directive.

Equipment Blank Assessment

Equipment blanks (Figure 7) are prepared and analyzed to document contamination attributable to the sample collection process. An equipment blank was collected after decontamination of non-dedicated tubing used to collect surface water samples at five locations. Uranium was detected in the equipment blank at a concentration slightly above the detection limit. All uranium sample results at the associated locations were greater than 5 times the equipment blank, so no further qualification is required. The equipment blank results indicate adequate decontamination of the sampling equipment.

Field Duplicate Assessment

Field duplicate samples (Figure 8 and Figure 9) are collected and analyzed as an indication of overall precision of the measurement process. The precision observed includes both field and laboratory precision and has more variability than laboratory duplicates, which measure only laboratory performance. The relative percent difference (RPD) for duplicate results that are greater than 5 times the PQL should be less than 20%. The RPD is not used to evaluate results that are less than 5 times the PQL. For these results, the range should be no greater than the PQL. Duplicate samples were collected from floodplain locations 0618, 0735, 1115, and 1142, and terrace locations 0818, 1070, 1078, and 1087. The duplicate results met the acceptance criteria for all analytes with the following exceptions. The potassium results for floodplain location 1115 and the uranium results for floodplain location 1142 did not meet the acceptance criteria. The associated sample and duplicate results are qualified with a “J” flag as estimated values.

Sampling and Analysis Work Order
August 26, 2016

U.S. Department of Energy
Office of Legacy Management
ATTN: Mark Kautsky
Site Manager
2597 Legacy Way
Grand Junction, CO 81503

SUBJECT: Contract No. DE-LM0000421, Navarro Research & Engineering, Inc. (Navarro) Task Assignment 103 LTS&M - UMTRCA Title I and II Sites, D&D Sites, Other Sites, and Other September 2016 Environmental Sampling at the Shiprock, New Mexico, Disposal Site

REFERENCE: Task Assignment 103, 1-103-1-02-119, Shiprock, New Mexico, Disposal Site

Dear Mr. Kautsky:

The purpose of this letter is to inform you of the upcoming sampling event at Shiprock, New Mexico. Enclosed are the map and tables specifying sample locations and analytes for monitoring at the Shiprock Site. Water quality data will be collected at this site as part of the routine environmental sampling currently scheduled to begin the week of September 26, 2016.

Samples collected at the following SHP01 (floodplain) locations will be both filtered and unfiltered: 0501, 0897, 0899, 0940, 0956, 0965, 0967, 1203, and 1205.

The following lists show the monitoring wells (along with associated zone of completion) and surface locations scheduled for sampling during this event.

Re: Sampling Trip Report

Site: Shiprock, NM, Floodplain (SHP01) and Terrace (SHP02)

Dates of Sampling Event: September 26-29, 2016

Team Members: David Atkinson, Tony Franzone, Jennifer Graham, Jeff Price, Rob Rice, Dan Sellers, and Samantha Tigar, all from Navarro.

Sampling Summary: Samples were collected from 126 of the 145 locations identified on the sampling notification letter as shown in Table 1. An additional sub set of samples was collected in support of the Terrace Work Plan Investigation. Explanations for locations not sampled are listed in Table 2.

Table 1: Sampled versus Planned Location Summary

<table>

<td>Dry</td>
</tr>
<tr>
<td>SHP02 Monitoring well: 1049</td>
<td>Replaced pump head tubing.</td>
</tr>
<tr>
<td>SHP02 Extraction well: 1088</td>
<td>Well not currently operating/ not sampled per site lead.</td>
</tr>
<tr>
<td>SHP02 Surface locations: 0949, 1218, and 1220</td>
<td>Dry</td>
</tr>
</tbody>
</table>
Location Specific Information:

- Location specific information is listed below in Tables 3 and 4.
- Both regular semiannual samples and special analytes were collected at select locations, along with field measurements for total chlorine. The additional analytes and field measurements were collected in accordance with the Terrace Work Plan Investigation. Additional analytes collected included hydrogen and oxygen isotopes, uranium isotopes, enriched tritium, and sulfur and oxygen isotopes. Field measurements for total chlorine were obtained at select locations using a manganese interference method.

Table 3: SHP01 Location Specific Information

<table>
<thead>
<tr>
<th>Location IDs</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>0625, 0628</td>
<td>Purge water contained black particulates. Data Logger was removed in order to sample. Purge water contained roots and black particulates. Initial water level was below recorded screened interval. Well maintained water level during sampling.</td>

</tr>
</thead>
<tbody>
<tr>
<td>0837</td>
<td>Purge water contains particulates.</td>
</tr>
<tr>
<td>0848</td>
<td>Bladder pump has a bad check valve.</td>
</tr>
<tr>
<td>1011</td>
<td>Well did not produce enough water to collect all requested samples. Samples were collected in a prioritized order and only a metals sample was collected.</td>
</tr>
</tbody>
</table>

Requisition Index Numbers (RIN) Assigned: Samples were assigned to RINs 16098030 (SHP01), 16098031 (SHP02), 16098033 (hydrogen and oxygen isotopes; sulfur and oxygen isotopes), and 16098034 (enriched tritium and uranium isotopes). Field data sheets can be found in \crow\SMS\16098030\FieldData and \crow\SMS\16098031\FieldData.

Quality Control Sample Cross Reference: The false identifications assigned to the quality control samples are presented in Table 5.

Sample Shipment: All samples were shipped overnight via FedEx from Grand Junction to the respective laboratories on October 03, 2016.

Water Level Measurements: Water levels were measured in all sampled wells and in 11 additional wells. Water level data reports for these 11 wells can be found in \crow\SMS\FDCS\WATER LEVELS.

Sampling Method: Samples were collected according to the Sampling and Analysis Plan (SAP) for the U. S. Department of Energy Office of Legacy Management Sites (LMS/PRO/S04351, continually updated) and Program Directive SHP-2015-01. Total chlorine measurements were taken using the Hach procedures manual for colorimeter model DR-890.

Field Variance: Turbidity requirements could not be met for Category I well SHP01-1143. These samples were filtered.

Equipment: All equipment functioned properly. Multi-gas meters were used to verify the air quality in the vaults. Colorimeter Hach DR-890 was used to collect field measurements for total chlorine.

Stakeholder/Regulatory/DOE: Nothing to note.

Institutional Controls:
- Fences, Gates, and Locks: All gates were left locked and in operable condition.
- Signs: No issues were observed.
- Trespassing/Site Disturbances: None observed.
- Disposal Cell/Drainage Structure Integrity: No issues observed.

Safety Issues: Air monitoring was completed prior to confined space entry. Results for all vaults indicated safe conditions.

Access Issues: SHP02 seep location 1220 was altered by a significant flash flood earlier in the monsoon season and is now dry.

General Information: Nothing to note.

Immediate Actions Taken: New downhole tubing was installed at SHP01-1135.

Future Actions Required or Suggested: Locations SHP01: 1134, 1136, and 1203 need to have vegetation removed for access.

SAMPLE ID CODES: 000X = Filtered sample (0.45 µm). N00X = Unfiltered sample. X = replicate number.

LAB QUALIFIERS:
* Replicate analysis not within control limits.
> Result above upper detection limit.
A TIC is a suspected aldol-condensation product.
B Inorganic: Result is between the IDL and CRDL. Organic: Analyte also found in method blank.
C Pesticide result confirmed by GC-MS.
D Analyte determined in diluted sample.
E Inorganic: Estimate value because of interference, see case narrative. Organic: Analyte exceeded calibration range of the GC-MS.
H Holding time expired, value suspect.
I Increased detection limit due to required dilution.
J Estimated
N Inorganic or radiochemical: Spike sample recovery not within control limits. Organic: Tentatively identified compound (TIC).
P > 25% difference in detected pesticide or Aroclor concentrations between 2 columns.
U Analytical result below detection limit.
W Post-digestion spike outside control limits while sample absorbance < 50% of analytical spike absorbance.
X,Y,Z Laboratory defined qualifier, see case narrative.

DATA QUALIFIERS:
F Low flow sampling method used.
G Possible grout contamination, pH > 9.
J Estimated value.
L Less than 3 bore volumes purged prior to sampling.
Q Qualitative result due to sampling technique.
R Unusable result.
U Parameter analyzed for but was not detected.
X Location is undefined.

QA QUALIFIER:
# Validated according to quality assurance guidelines.

SAMPLE ID CODES:  000X = Filtered sample (0.45 µm).  N00X = Unfiltered sample.  X = replicate number.

LAB QUALIFIERS:
* Replicate analysis not within control limits.
> Result above upper detection limit.
A TIC is a suspected aldol-condensation product.
B Inorganic: Result is between the IDL and CRDL. Organic: Analyte also found in method blank.
C Pesticide result confirmed by GC-MS.
D Analyte determined in diluted sample.
E Inorganic: Estimate value because of interference, see case narrative. Organic: Analyte exceeded calibration range of the GC-MS.
H Holding time expired, value suspect.
I Increased detection limit due to required dilution.
J Estimated value.
N Inorganic or radiochemical: Spike sample recovery not within control limits. Organic: Tentatively identified compound (TIC).
P > 25% difference in detected pesticide or Aroclor concentrations between 2 columns.
U Analytical result below detection limit.
W Post-digestion spike outside control limits while sample absorbance < 50% of analytical spike absorbance.
X,Y,Z Laboratory defined qualifier, see case narrative.

DATA QUALIFIERS:
F Low flow sampling method used.
G Possible grout contamination, pH > 9.
J Estimated value.
L Less than 3 bore volumes purged prior to sampling.
Q Qualitative result due to sampling technique.
R Unusable result.
U Parameter analyzed for but was not detected.
X Location is undefined.

QA QUALIFIER:
# Validated according to quality assurance guidelines.

SAMPLE ID CODES:  000X = Filtered sample (0.45 µm).  N00X = Unfiltered sample.  X = replicate number.

LAB QUALIFIERS:
* Replicate analysis not within control limits.
> Result above upper detection limit.
A TIC is a suspected aldol-condensation product.
B Inorganic: Result is between the IDL and CRDL. Organic: Analyte also found in method blank.
C Pesticide result confirmed by GC-MS.
D Analyte determined in diluted sample.
E Inorganic: Estimate value because of interference, see case narrative. Organic: Analyte exceeded calibration range of the GC-MS.
H Holding time expired, value suspect.
I Increased detection limit due to required dilution.
J Estimated
N Inorganic or radiochemical: Spike sample recovery not within control limits. Organic: Tentatively identified compound (TIC).
P > 25% difference in detected pesticide or Aroclor concentrations between 2 columns.
U Analytical result below detection limit.
W Post-digestion spike outside control limits while sample absorbance < 50% of analytical spike absorbance.
X,Y,Z Laboratory defined qualifier, see case narrative.

DATA QUALIFIERS:
F Low flow sampling method used.
G Possible grout contamination, pH > 9.
J Estimated value.
L Less than 3 bore volumes purged prior to sampling.
Q Qualitative result due to sampling technique.
R Unusable result.
U Parameter analyzed for but was not detected.
X Location is undefined.

QA QUALIFIER:
# Validated according to quality assurance guidelines.

</table>
SAMPLE ID CODES: 000X = Filtered sample (0.45 µm). N00X = Unfiltered sample. X = replicate number.

LAB QUALIFIERS:
* Replicate analysis not within control limits.
> Result above upper detection limit.
A TIC is a suspected aldol-condensation product.
B Inorganic: Result is between the IDL and CRDL. Organic: Analyte also found in method blank.
C Pesticide result confirmed by GC-MS.
D Analyte determined in diluted sample.
E Inorganic: Estimate value because of interference, see case narrative. Organic: Analyte exceeded calibration range of the GC-MS.
H Holding time expired, value suspect.
I Increased detection limit due to required dilution.
J Estimated
N Inorganic or radiochemical: Spike sample recovery not within control limits. Organic: Tentatively identified compound (TIC).
P > 25% difference in detected pesticide or Aroclor concentrations between 2 columns.
U Analytical result below detection limit.
W Post-digestion spike outside control limits while sample absorbance < 50% of analytical spike absorbance.
X,Y,Z Laboratory defined qualifier, see case narrative.

DATA QUALIFIERS:
F Low flow sampling method used.
G Possible grout contamination, pH > 9.
J Estimated value.
L Less than 3 bore volumes purged prior to sampling.
Q Qualitative result due to sampling technique.
R Unusable result.
U Parameter analyzed for but was not detected.
X Location is undefined.

QA QUALIFIER:
# Validated according to quality assurance guidelines.

Assessment of Anomalous Data
This page intentionally left blank
Potential Outliers Report
Potential Outliers Report

Potential outliers are measurements that are extremely large or small relative to the rest of the data and, therefore, are suspected of misrepresenting the population from which they were collected. Potential outliers can result from transcription errors, data-coding errors, or measurement system problems. However, outliers can also represent true extreme values of a distribution and can indicate more variability in the population than was expected.

Statistical outlier tests give probabilistic evidence that an extreme value does not “fit” with the distribution of the remainder of the data and is therefore a statistical outlier. These tests should only be used to identify data points that require further investigation. The tests alone cannot determine whether a statistical outlier should be discarded or corrected within a data set.

There are three steps involved in identifying extreme values or outliers:

1. **Identify extreme values that may be potential outliers.** Do this by generating the Outliers Report using the Sample Management System from data in the environmental database. The application compares the new data set (in standard environmental database units) with historical data and lists the new data that fall outside the historical data range. A determination is also made as to whether the data are normally distributed using the Shapiro-Wilk Test.

2. **Apply the appropriate statistical test.** Dixon's Test for extreme values is used to test for statistical outliers when the sample size is less than or equal to 25. This test considers both extreme values that are much smaller than the rest of the data (case 1) and extreme values that are much larger than the rest of the data (case 2). This test is valid only if the data without the suspected outlier are normally distributed. Rosner's Test is a parametric test that is used to detect outliers for sample sizes of 25 or more. This test also assumes that the data without the suspected outliers are normally distributed.

3. **Scientifically review statistical outliers and decide on their disposition.** The review should include an evaluation of any notable trends in the data that may indicate the outliers represent true extreme values.

Unfiltered surface water samples are expected to exhibit high variability in the results due to the nonhomogeneous nature of the samples and were not evaluated for outliers.

Twelve analytical results were identified as potential outliers (see the Data Validation Outliers Reports on the following pages). There is no indication that there are errors associated with the data identified as potential outliers and the data from this event are acceptable as qualified.
### Data Validation Outliers Report - No Field Parameters

**Comparison: Historical Data Beginning 1/1/2006 for Filtered Surface Water Samples**

</table>

**Statistical Tests:**

The distribution of the data is tested for normality or lognormality using the Shapiro-Wilk Test. Outliers are identified using Dixon's Test when there are 25 or fewer data points. Outliers are identified using Rosner's Test when there are 26 or more data points. See Data Quality Assessment: Statistical Methods for Practitioners, EPA QC/G-9S, February 2006.

*NA*: Data are not normally or lognormally distributed.

**STATISTICAL TESTS:**

The distribution of the data is tested for normality or lognormality using the Shapiro-Wilk Test.
Outliers are identified using Dixon's Test when there are 25 or fewer data points.
Outliers are identified using Rosner's Test when there are 26 or more data points.

**NA:** Data are not normally or lognormally distributed.

**STATISTICAL TESTS:**
The distribution of the data is tested for normality or lognormality using the Shapiro-Wilk Test. Outliers are identified using Dixon's Test when there are 25 or fewer data points. Outliers are identified using Rosner’s Test when there are 26 or more data points. See Data Quality Assessment: Statistical Methods for Practitioners, EPA QC/G-9S, February 2006.

NA: Data are not normally or lognormally distributed.
