SUBJECT: Contract No. DE-AC24-97OH20044
BUILDING DS: DELIVERY OF FINAL BUILDING DATA PACKAGE

REFERENCE: Statement of Work Requirement C 7.1e -- Regulator Reports

Dear Mr. Provencher:

In response to an agreement reached at the March Core Team meeting, BWO has revised the Building DS Building Data Package to explicitly indicate the fact that the Core Team binned PRS 128 as NFA at the same time DS Building was binned NFA. Frank Schmaltz of MEMP has authorized the release of this revision package to USEPA, OEPA, and ODH. Copies will also be distributed to the MMCIC and the Public Reading Room. Attached are two change pages. Remove the corresponding pages from the Final Rev. 1 version of the Building Data Package to produce the new version (Final Rev. 2).

Please advise if additional copies are required for distribution within DOE. If you require further information, please contact Dave Rakel at extension 4203.

Sincerely,

Linda R. Bauer, Ph.D.
Manager, Environmental Safeguards & Compliance

MOUND PLANT BUILDING DATA PACKAGE

Notice of Public Review Period

The following Building Data Package will be available for public review in the CERCLA Public Reading Room, 305 E. Central Ave., Miamisburg, Ohio beginning June 17, 1998. Public comment will be accepted on this package from June 17, 1998, through July 17, 1998.

BDP DS Bldg. Development/Standards

Written comments may be sent to U.S. Department of Energy, c/o Paul Lucas, P.O. Box 66, Miamisburg, Ohio 45343-0066 or by E-Mail to: *paul.lucas@em.doe.gov*

Questions can be referred to DOE Office of Public Affairs at (937) 865-4578

The Mound Core Team
P.O. Box 66
Miamisburg, Ohio 45343-0066

Mr. Stan Abrahamson
Property Manager
Miamisburg Mound Community Improvement Corporation
720 Mound Road
Miamisburg, Ohio 45342-6714

Dear Mr. Abrahamson:

The Core Team, consisting of the U.S. Department of Energy Miamisburg Environmental Management Project (DOE-MEMP), U.S. Environmental Protection Agency (USEPA), and the Ohio Environmental Protection Agency (OEPA), appreciates your comments on the DS Building Data Package.

Attached please find responses to comments for the DS Building Data Package.

Should the responses to comments require additional detail, please contact Art Kleinrath at (937) 865-3597, and we will gladly arrange a meeting or telephone conference.

Sincerely,

DOE/MEMP: Arthur W. Kleinrath, Remedial Project Manager 11/10/98

USEPA: Timothy J. Fischer, Remedial Project Manager

OHIO EPA: Brian K. Nickel, Project Manager

Substantive Comments

1. In Section 3.2, *Summary of Environmental Concerns and Findings*, of the Building DS Data Package, it appears that the majority of the environmental concerns have been addressed and removed or will be remediated as part of a different project. However, the disposition of the following concerns either need further clarification or needs to be addressed:

- Section 2.3 notes that interior solvent drain lines were "emptied and confirmed emptied in October 1996," as noted in the HOK/K ASTM Report (Appendix P). The HOK/K report states that the solvent drain lines had been disconnected from the solvent storage shed (also empty) and that Mr. Bornemann (key site manager for the report) had opened the valves to the piping in Room 125 and no solvent had discharged. However, HOK/K had also stated in Section 7.0 of their report, *Findings and Conclusions*, that "the interior solvent drain pipes that formerly carried [raw product and] spent solvent [to and] from the solvent sinks and ...the Building DS solvent storage shed are still in place. The entire plumbing network and location of the lines should be determined, and if necessary the pipes should be drained and removed." Although these lines are no longer actively connected, they are still in place and there is no evidence that they have been thoroughly cleaned. Pockets or residues of solvents/chemicals that were used in the lines may still be present. If the drain lines are to be permanently abandoned, they should be cleaned and removed. If the possibility exists that they may be reused, the lines should be cleaned or documentation should be produced that indicates that they have been cleaned.

Response:

At the time of the binning decision, the Core Team was aware of the recommendation to clean/remove these lines. Although it is possible that there is solvent or product in the lines, the Core Team decided that this does not pose a concern for human health or the environment as long as this information is available. The next operator of the building will decide if the lines are permanently abandoned or reused.

- Appendix L of the Building DS Data Package includes a significant amount of soil sampling analytical results. A number of these surface samples and borehole samples produced analytical results that exceed background values or 10^{-6} Guideline Values for the constituent in question (including plutonium-238, thallium, beryllium, selenium, and magnesium). No mention is made in Section 2.3 of the Building Data Package as to how, when, or under what project administration these soil exceedances will be addressed. Section 2.3 does mention a concern of "PU-238 & Thorium in Soil," indicating that a Pu-238 sample result of 268 pCi/g and a thorium sample of 11.6 pCi/g were detected. ID SCR 307, "...approximately 45 feet south from the footprint of DS

238 & Thorium in Soil," indicating that a Pu-238 sample result of 268 pCi/g and a thorium sample of 11.6 pCi/g were detected. ID SCR 307, "...approximately 45 feet south from the footprint of DS Building," is then referenced, presumably as the location of the Pu-238 and thorium detections. However, SCR 307 is not included in the data presented in Appendix L. Clarification of the management of these soil exceedances needs to be included in the Building DS Data Package.

Response:

SCR 307 is the location of the 268 pCi/g ^{238}Pu and 11.6 pCi/g thorium measurements. Since this location is approximately 45 feet from the building. The data for this location are not listed in Appendix L. This location will be addressed as PRS 415, a new PRS.

Sampling locations A1-14, SO 368, SO 396, and SO 377 are within 15 feet of DS Building and exhibit measurement results above background values but not above 10^{-6} Guideline values. The core team decided that these locations do not need further investigation or review.

Sampling locations A2-8 and A1-11 exhibit measurement results for some constituent above background and 10^{-6} Guideline values but not above 10^{-5} Guideline values. These locations will be addressed in PRS 415 and evaluated by the Core Team.

- The following Recognized Environmental Condition was stated in the HOK/K Phase 1 ASTM Report:

"A sink in the X-ray photographic dark room sits on a raised concrete dais with a metal cover, and piping from the photographic development machine appears to be routed into the dais. Our key site manager did not know what features were below the metal cover. The construction, condition, and contents of the area below the metal cover should be investigated."

There is no statement in the Building DS Data Package indicating that this feature has been investigated or the issue resolved.

Response:

The DS Building Data Package did not discuss the dais. In subsequent investigation the metal cover was raised. The area below the metal cover consists of an elevated curb, most probably intended to serve as a catch for sink discharge. The catch is empty and there is no obvious evidence of residual substance.

2. MMCIC is utilizing the areas immediately adjacent to Building DS for parking spaces for the commercial businesses in E Building and DS Building. MMCIC plans to pave these gravel areas once remediation of the cobalt-60 contaminated drain lines (PRS 122) is completed. MMCIC asks that 1) it be notified prior to initiation of remediation activities so that alternate parking can be arranged for its tenants, and that 2) once remediation of PRS 122 is completed, the areas surrounding Building DS be restored and graded to a condition sufficient for paving the new parking areas.

Response:

The Core Team appreciates this information about MMCIC's plans for this area and understands the concern. The DOE will keep MMCIC informed as plans for PRS 122 are developed.

3. MMCIC personnel have observed brown viscous material oozing between the floor tile in numerous places in the west end of the building. Presently, July 20, 1998, it is most apparent in Room DS 209.

Response:

The Core Team thanks you for pointing out the conditions in DS 209. In subsequent visits to that room, it appeared that moisture, possibly condensation, has entered under the floor tiles. Water mixed with dirt, grease, and floor adhesive has worked its way out between the cracks of the tile. No process took place in DS 209 that would account for the presence of the material. No further action is planned.

4. Metrology and several User Center operations are being carried out by BWO in the building. As with the PRS 122, the environmental impact of their continued operation should be evaluated, and if necessary, cleanup prior to title transfer.

Response:

The Building Data Package describes conditions at a particular point in time. For DS Building, it is March 1998. Before title for a piece of Mound Site is transferred, additional environmental reviews (Residual Risk Evaluation) and disclosure summaries (FOST-like document) will be performed. The environmental impact of continued operations in DS will be evaluated prior to title transfer.

Errata

1. Section 4.2.2.3 is poorly worded or in error. It states that "there are no known hazardous materials, petroleum products or chemicals, other than the water-soluble non-hazardous cutting oil (cimperial 1011) associated with current or past operation in DS Building." This statement is contradicted by Appendix F and Appendix K, in which chemicals/compounds such as mercury, acetone, Freon, etc. are listed, and the documented historical use of explosives, X-rays, solvents, and photographic chemicals in Building DS.

   The wording in this Section 4.2.2.3 should be clarified.

Response:

Section 4.2.2.3 has been changed to read "All chemicals from previous operations have been removed from the building. Remaining chemicals are associated with current user centers and BWO metrology."

2. Section 4.2.2.1 is also poorly worded or in error. It states that "the DS Building safe shutdown survey indicated no direct or removable contamination on the building's floors, corridors, or stairways." This is contradicted by data in Appendix G that shows a number of floor sample radiological detections (as well as equipment, machinery, and cabinet/furniture sample radiological detections) reported during 1996 Building DS radiological surveys. The sample locations associated with these detections were either posted as Controlled Areas and later decontaminated or, if a moveable item, were bagged/tagged and relocated to a Radiological Management Area in another room or building.

   The wording in Section 4.2.2.1 should be clarified.

Response:

Section 4.2.2.1 has been changed to read "DS Building safe shutdown surveys conducted in 1996 did indicate one contaminated location in Room 221 D. Subsequent to cleanup, readings verified the removal of the contamination. No direct or removable contamination remains on the building floors, corridors, or stairways. The equipment identified as contaminated during the 1996 survey has been removed from the building." In addition, the results of a survey performed recently (9/21/98) in Rooms 221 C and D will be added to Appendix G.

3. Pages are missing from the Science and Engineering Associates, Inc. (SEA) report in Appendix N, regarding radiological and video surveys of the radiological drain lines under Building DS. There is no indication that this appendix was intended to include only excerpts of the SEA report.

Response:

Appendix N will be retitled to note "Excerpts."

MOUND PLANT RECOMMENDATION

DS BUILDING

Background:

DS Building is a 47,810 square foot single story concrete building with a built up membrane roof and three penthouses. It was constructed in 1965 and served as the Metrology Lab and Explosive Testing Facility. PRS 128, the DS Building Solvent Storage Shed, is also considered as part of this facility.

Recommendation:

After thorough review of the environmental data and the Building Data Package, the Core Team agrees that no environmental concerns are associated with DS Building. Because of the presence of PRS 122 (radioactive waste lines) located underneath DS Building, the Core Team has determined that it is not appropriate to transfer DS Building at this time. After PRS 122 is evaluated as NFA or clean up has been completed, title transfer for DS Building can occur. However, the Core Team feels that DS Building is protective of human health and the environment for the purpose of leasing for commercial/industrial use.

1.0 General Overview

1.1 Introduction

The purpose of this Building Data Package is to identify, if possible, any recognized environmental conditions (defined below) that may affect the subject property. The intended building disposition is "transfer." Ultimate disposition is a function of building condition and DOE/EPA evaluation.

Recognized Environmental Condition – The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a likely release, a past release, or a material threat of a release of any hazardous substances or petroleum into structures or into the ground, ground water, or surface water near the building.

1.2 Scope

This document has been prepared in response to an agreement between the Department of Energy (DOE), the U.S. Environmental Protection Agency, and the Ohio Environmental Protection Agency. It is a Building Data Package of DS Building located at the DOE Mound Plant in Miamisburg, Ohio. This investigation was performed to support procedures as found in ASTM Standard Practice for Environmental Site Assessments; Phase I Environmental Site Assessment Process (Designation E 1527-94).

The scope of the investigation included the building, the soils beneath the building, and a 15-foot wide perimeter border around the building. This perimeter includes roadways, sidewalks, pavement, and grass covered areas. The investigation of DS Building included the following.

1) A building and perimeter inspection
2) An examination of historical aerial photographs and maps.
3) A review of federal and state regulatory agency records.
4) Personnel interviews.
5) A review of Mound Plant records for:
   A) History of spills and releases
   B) Past sampling data
      - Radiological survey
      - Chemical history
      - Lead paint
      - Asbestos
      - Radon

The building investigation was conducted by BWO personnel on December 1st and 2nd, 1997.

This report used a variety of previous assessments completed by BWO Mound and/or its subcontractors. The reports used were as follows:

- Characterization of Mound's Hazardous, Radioactive, and Mixed Wastes, (August 1990)
- OU-9 Site Scoping Report, Volumes 1-12
- Mound Facility Physical Characterization, December 1992
- Active Underground Storage Plan, November 1994.
- OU-9 Hydrological Investigation Bedrock Report, January 1994.
- OU-9 Hydrological Investigation, Buried Valley Aquifer Report, March 1994
- Environmental Appraisal of the Mound Plant, March 1996
- Phase 1 Environmental Site Assessment of DS Building, (November 1996)
- Results of Radiological and Video Surveys of Drain Lines at the USDOE Mound Facility with the Pipe Explorer $_{TM}$ System, (January 1997)
- Title Search
- Lease Information
- EDR Report
- Building Prints

2.0 Building Specific Overview

Mound Plant is located in the southern portion of the corporation limits of Miamisburg, Ohio. The entire Mound Plant facility is situated on 305 acres of land and contains more than 132 buildings. The subject property consists of Mound Plant DS Building footprint and an arbitrary 15-foot wide perimeter around the building. DS Building contains 47,810 square feet. It was constructed in 1965. No waste was stored in DS Building.

2.1 Current Uses of DS Building

The building houses metrology, receiving inspection and "User Centers" leased to the MMCIC. User Center activities include photographic processes for flexible circuits (Star City), laser resistance welding (Precision Joining Technologies) and calibration activities (Mound Metrology Inc.). Most activities are restricted to the east part of the building. (See Appendix D.)

2.2 Past Uses of DS Building

The building was used for metrology and explosives production and development.

2.3 Summary of Environmental Concerns and Findings

DESCRIPTION	COMMENT	RESOLUTION
Lead Paint	Due to the age of the building it is assumed lead paint is present.	Any cracking or peeling paint has been removed. Ref. Para. 4.2.2.4
Chemicals	The DS Building solvent storage shed has been identified as PRS 128.	A search of OU9, Volume 11, Spills and Response Actions, and discussions with historical experts validates a determination that there were no historical spills. Ref. Para. 4.2.2.3 Ref. Para. 4.2.1.3
Radiological	The Radiological Contaminated Areas have been decontaminated with the exception of two items.	These two items have been disposed of and the building is no longer posted. These items were removed on 4/1/98 by rad ops. Ref. Para. 4.2.2.1
Stains & Corrosion	Rust stains on floor of Room 125A were of a size and location indicating that they resulted from corrosion of metal spacers supporting the solvent tank. No evidence of overflow of solvents from the storage tank itself based on the interview with the building manager.	Have been cleaned up. Ref. Para. 5.1.3
Underground Lines	T-Building related Cobalt 60 contamination.	Will be treated as PRS 122 under the soils project. Ref. Para. 4.2.1.3
Beryllium	Equipment in 131A was potentially contaminated.	The potentially contaminated equipment was removed in the 1980s. Ref. Para. 5.7 Ref. Appendix O, page 3 of 9
Pu-238 & Thorium in Soil	Pu-238 sample was 268 pCi/g. The thorium was 11.6 pCi/g. ID SCR 307 is approximately 45 feet south from the footprint of DS Building.	Will be evaluated as PRS 415.
Interior Solvent Drain Lines	Pipeline integrity is subject of concern.	HOKK ASTM Report, page 35 describes that the lines were emptied and confirmed empty in October 1996.

2.4 Radiological Characterization Summary For DS Building Structure

TYPE	RSDS	LOCATION	SURVEY RESULTS (dpm/100 cm2)	5400.5 Guidelines for Groups 1, 3, 4 (fixed + loose) (dpm/100 cm2)	NUREG 1500 Guidelines (loose) (dpm/100 cm2)	Attachment 1 Limit (fixed + loose) (See Note 2.) (dpm/100 cm2)	COMMENTS

PRS 128	Building Related	NFA	DS Building Solvent Storage Shed (emptied)
PRS 122	CERCLA	TBD	Underground Rad Transfer Lines from T-Building

3.0 Site Description

3.1 Site/Vicinity Location and Characteristics

DS Building is located at the U.S. Department of Energy Facility known as Mound Plant. Mound is situated in the city of Miamisburg, Miami Township, Montgomery County, state of Ohio.

The Mound facility is situated on 305 acres of land and contains approximately 130 buildings with a total of approximately 1.4 million square feet of floor space (the number of buildings is constantly diminishing as buildings are decommissioned and either sold or demolished). The original 182-acre site, purchased by the Manhattan Engineering District in 1946, consists of two hills and an intervening valley that runs approximately east and west. DS Building is located on the Main Hill. The 124-acre tract, acquired in 1981, is an undeveloped mixture of fields and woods that undulates and slopes downward to the west, away from the main site. This area was acquired to serve as a buffer and has been used as a staging area and parking area for contractors working on-site.

To the west lies a Conrail Railroad line and the north south trending Miami-Erie Canal. The northern boundaries of the site abuts the historic residential area of Miamisburg, Ohio. Mound Road marks the northern half of the eastern perimeter of the facility then veers east, away from the southern half of the eastern boundary. A public golf course (belonging to the City of Miamisburg), the Miamisburg Mound Memorial Park, old agricultural fields; residential lots, and vacant wooded lots border against the facility along Mound Road. Benner Road forms the southern property line of the Mound Plant, with agricultural fields and farms occupying the lands beyond.

3.2 Description of Structures, Roads, Other Improvements Related to DS Building

DS Building is a one-story, 47,810-square foot structure of reinforced concrete and concrete block with a built-up membrane roof and three penthouses. Heating and air conditioning systems are central steam and chilled water. DS Building was constructed in 1965.

Potable water and sanitary services at DS Building are provided by the facility. The Mound Plant operates a potable water treatment plant (Building 24) that provides drinking water to the facility using groundwater produced from three on-site production wells. The Mound facility also operates an on-site sanitary sewer treatment plant (Building 57) to

manage the plant's sanitary waste water pursuant to a Nation Pollution Discharge Elimination System (NPDES) permit issued by OEPA. Due to the location of DS Building, the sanitary waste must be lifted to the Mound sanitary sewer system. The "ejector" lift station is located approximately 50 feet to the west of DS Building.

3.3 Current and Past Uses of Buildings Adjacent To DS Building

This information is documented in the Phase I, Environmental Site Assessment of DS Building, prepared by HOK/K, (See Appendix P).

4.0 General Records Review

4.1 General/Historical CERCLA Information

The Mound Plant site was identified as a contaminated site on the National Priority List under CERCLA (Superfund) in 1989. The Mound Plant site was originally listed as a consequence of historic disposal practices including use of a commercial/industrial landfill, various spills, and the use of underground storage tanks, resulting in the contamination of soils and drinking water. The original contaminants of concern were calcium cyanide, copper cyanide, plutonium and its isotopes and compounds, specifically plutonium-238, and uranium, its isotopes and compounds. The clean-up of the Mound Site was originally to be accomplished under the CERCLA mandated procedures for regulating Superfund Sites using the operable unit (OU) system to define and characterize clean-up areas. As the clean-up effort went forward, it became apparent that the Mound Site did not fit the profile for a clean-up strategy based on the operable units. The Department of Energy (DOE), the United States Environmental Protection Agency (USEPA), and the Ohio Environmental Protection Agency (OEPA) designed a new decision making process for the clean-up of Mound. The new process is known formally as a "removal site evaluation process" and informally as the "Mound 2000 process." The Mound 2000 process system divided Mound in 19 Release Blocks containing over 400 Potential Release Sites (PRSs) with approximately 200 concerned with potentially contaminated soils, and the balance with potential contamination in or associated primarily with building operations.

In compliance with permit requirements under RCRA, the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA), and the Clean Air Act (CAA), Mound Plant has applied for or has received permits for its surface water discharges, air emissions, and hazardous waste program. Mound Mound Plant is currently operating a hazardous waste treatment and storage facility under a new RCRA Part B permit dated October 18, 1996. Mound Plant also maintains a NPDES surface water discharge permit with Facility I.D. number OH 009857. Permits for the open burning of wastes involving explosives and other fuels have been issued by the Regional Air Pollution Control Agency (RAPCA). Other operations that produce particulate or vaporous emissions are registered with RAPCA and OEPA. Mound Plant also submits annual Emergency and Hazardous Chemical Inventory forms to the OEPA, pursuant to SARA, Title III, the Emergency Planning and Community Right-to-Know Act. The 1995 version of this report indicated that no chemicals are stored in DS Building in quantities above the regulatory thresholds. (See Appendix K.)

4.2 Specific Record Sources

4.2.1 History of Past Occurrences, Spills, and Releases

4.2.1.1 Occurrence Reports (See Appendix M.)

An interview with the Occurrence Report Manager, Jeff Boston indicates that there were six Occurrence Reports submitted for DS Building during the period from 1991 to 1997. Of the six reports, four were related to fire alarm system malfunctions and the actuation of the fire protection sprinkler system. One report involved a cooling system ethylene glycol spill. The spill was cleaned and there was no release to the environment. In 1996 radiological contamination was found in several areas of the building during a safe shutdown radiological survey. As a result, some areas in the west end of the building were posted as Radiological Contamination Areas. The majority of these have been decontaminated / removed. The remaining contaminated items have been removed from the building.

4.2.1.2 Spills and Releases

There was no other spills reported other than those identified in the Occurrence Reports.

4.2.1.3 Associated PRS Overview

As a result of the investigations and documentation conducted to comply with the CERCLA cleanup process via the FFA/DOE ER program, DOE and B&W of Ohio have tabulated all the Potential Release Sites (PRSs) identified under the various regulatory programs in effect at the site. Many additional contaminants of concern and types of operations were identified beyond the original NPL listing of site activities. A total of 413 PRSs have been identified. One of these 413 PRSs, PRS 128, has been attributed to DS Building. PRS 122, attributable to T-Building, is related by geographic proximity.

PRS 128 - DS Building Solvent Storage Shed: This storage shed is located at the southeast corner of DS Building. During the on-site inspection, this building was empty; however, the OU-9 Site Scoping Report: Volume 12-Site Summary Report, December 1994 has the shed listed as in service. According to the report, chemicals stored in the shed included organic solvents (including 1,1,1-trichloroethane, trichlorofluoromethane, ethanol, and trichloroethane). The report also recorded a suspected release from this storage area, although no additional information could be found. Sampling in the vicinity noted no contamination of concern above action levels. (See Appendix L.) The area is managed by the Mound plant operations and maintenance program. The shed is intended for future use.

PRS 122 - Radioactive waste lines from T-Building running under DS Building. A survey indicated the presence of Cobalt-60 in the lines. (See Appendix N.) This CERCLA PRS will be treated as a soils project.

4.2.2 Past Sampling Data

4.2.2.1 Radiation Surveys

DS Building safe shutdown surveys conducted in 1996 indicate one contaminated location in Room 221 D. Subsequent to cleanup, readings verified the removal of the contamination. No direct or removable contamination remains on the building floors, corridors, or stairways. The equipment identified as contaminated during the 1996 survey has been removed from the building. (See Appendix G.)

4.2.2.2 15-Foot Sampling Data Summary

See Appendix L.

4.2.2.3 Chemical History/Removal (As Applicable)

All chemicals from previous operations have been removed from the building. Remaining chemicals are associated with current user centers and BWO metrology. (See Appendix K.)

4.2.2.4 Lead Paint

Congress established maximum lead concentrations in residential paint in 1978. This building was constructed in 1965. Lead paint has been found in the building and all flaking paint has been removed.

4.2.2.5 Asbestos

Mound's Technical Manual, Asbestos Program Manual, MD-10391, indicates that (known, assumed, suspected) asbestos is found in DS Building. All asbestos observed was not friable.

4.2.2.6 Radon

The results of a 1980-90 Mound Indoor Radon Study indicated an average radon concentration of 0.4 picocuries/liter in DS Building. The EPA recommended standard for radon is 4.0 picocuries/liter. (See Appendix H.)

4.3 Aerial Photographs

Aerial photographs from 1994, 1983, 1973, 1968, 1965, 1959, and 1949, were reviewed and copies are found in Appendix E.

The 1949 photograph shows the completed initial phase of construction on the Mound Plant Main Hill. Approximately fourteen (14) buildings are visible. Roadways on both the Main Hill and the eastern hill are present.

The overall Mound Plant facilities, as depicted in subsequent years continue to show change and expansion.

DS Building is visible in the photograph dated 1965.

5.0 Site Reconnaissance/Inspections: Findings, Observations

See also Appendix F. Findings have been addressed; verified by teleconference with Building Manager on March 24, 1998.

5.1 Hazardous Substances in Connection with Identified Uses

5.1.1 Space

User Groups are working in the building using standard industrial processes.

5.1.2 Heating/Cooling

The building's heating and air conditioning systems are central steam and chilled water. The building has fire sprinkler service. These systems will continue in operation.

5.1.3 Stains or Corrosion

In the rear of Room 125A is a cleaning hood with solvent dispensers and a sump for previous cleaning operations. Under the cleaning hood are stains that appear to be from past chemical storage practices. These stains have been cleaned as far as practical. The building manager confirms that these stains were most probably rust from corrosion of spacers under a catch container.

Stains were also observed in several of the User Center rooms currently occupied by Star City. Chemical containers left stains under a work table in room 122. In addition, staining was observed in a chemical storage area in room 126A.

5.1.4 Drains and Sumps

The building is also serviced by storm drains according to the underground utility diagram.

5.1.5 Wastewater

Potable water and sanitary service was provided for DS Building. The Mound Plant facility operates an on-site sanitary and storm water sewer treatment plant (Building 57) to manage the plant's storm water and sanitary waste water pursuant to a National Pollution Discharge Elimination System (NPDES) permit issued by OEPA. No wastewater was generated in this area.

5.1.6 Septic Systems

There is no evidence of septic systems (such as leaching field or septic tank vent pipes) in the vicinity of DS Building. Building blueprints show a sewer ejector station to the west of the building. This station is necessary as the elevation of this area is below the Mound sanitary sewer line.

5.1.7 Suspected Asbestos Containing Material

ACM in buildings can be found in five (5) forms: sprayed or troweled on ceilings and walls (surfacing materials); insulation around pipes, ducts, boilers and tanks (pipe and boiler insulation); transite (in ground piping); and in roofing materials (shingles and roofing felts); other products such as ceiling and floor tiles and wall boards (miscellaneous materials).

Past records indicate asbestos is found in the building. All asbestos observed was not friable.

5.1.8 Paint

Lead based paint was used in the U.S. prior to 1978, when Congress established the limits on the maximum lead concentration allowable in residential buildings. The risk of a lead based paint hazard exists only when painted surfaces are damaged (cracked, chipped, loosened, or chewed).

Because of the age of the building, it is likely that lead based paint has been used. Chipped paint was found and has been removed.

5.2 Hazardous Substance Containers and Unidentified Substance Containers

No unidentified substances were found in or near DS Building. Process chemicals are utilized in the building.

5.3 Storage Tanks

No storage tanks are associated with DS Building.

5.4 Indications of PCBs

Fluorescent lighting is used in this building. It is assumed they contain PCBs. They will be replaced with normal maintenance.

5.5 Indications of Solid Waste Disposal

No solid waste was observed in the building. No evidence of hazardous waste was noted in the immediate vicinity of the building.

5.6 Physical Setting Analysis, If Migrating Hazardous Substances Are An Issue

Migrating hazardous substances are not an issue.

5.7 Other Conditions of Concern

Another point of concern was the presence of Beryllium in equipment in Room 131A. The potentially contaminated equipment has been removed. (See Appendix O.)

5.8 Recent Interviews

5.8.1 Building Manager Interview

The current Building Manager of DS Building, Mr. Jeff Boston, has been employed at the plant for 17 years and has been the Building Manager of DS Building for the last year and a half. (See Appendix F.)

5.8.2 Telephone Interviews

Telephone discussions on April 13, 1998 with Mr. Jack Melke, Mr. Paul Lamberger, and Mr. Orien Dodds indicate that no spills occurred at the DS Building Solvent Storage Shed. This collaborates information in OU9, Site Scoping Report: Volume II - Spills and Response Actions, Final, Rev. 0, March 1992.

5.9 Historical Interviews

Additional interviews were also completed in 1990 and 1995 involving personnel working in the process area at that time. (See MLM-ML-90-48-0001, Characterization of Mound's Hazardous, Radioactive, and Mixed Wastes, August 15, 1990.)

Environmental Appraisal Report of the Mound Plant for DS Building (Extract)

9.5 BUILDING DS

9.5.1 Scope of Building DS Report

In late 1995 and the early months of 1996, EG&G MAT performed a review of environmental conditions at the Mound Plant. The purpose was to develop a performance baseline, and to identify areas for improvement on a building and a sitewide basis. EG&G MAT did not perform a "due diligence" or Phase I Environmental Site Assessment as specified by ASTM 1527 or ASTM 1528. The scope of the appraisal effort and a discussion of the appraisal methodology are detailed in Sections 2.0 and 5.0, found in Volume 1 of this report.

The appraisal team performed a walk-through of Building DS on February 19, 1996. The Environmental Appraisal Checklist (EAC) was used to record findings. The EAC is found in Attachment 1 (Section 9.5.6.1). Escorting the appraisers were the building manager and other knowledgeable personnel such as the process owner. Other information was supplied by the building manager and recorded on the Building Manager's Questionnaire (BMQ), included as Attachment 2 (Section 9.5.6.2).

9.5.2 Description of Building DS

Building DS is a one-story, 47,810-square foot structure of reinforced concrete and concrete block with a built-up membrane roof and three penthouses. Heating and air conditiong systems are central steam and chilled water *(Mound Facility Physical Characterization*, 12-1-93). The location of Building DS is shown in Attachment 3 (Section 9.5.6.3).

Building DS was constructed in 1965 (MD-10391, *Asbestos Program Manual*, 9-14-95). The building was used for metrology, explosive production, and development. The building still houses metrology, however the majority of the building is in the process of safe shutdown. Floor plans for the building are included as Attachment 4 (Section 9.5.6.4). Some of the rooms are under the User's Center Agreement. Building DS is not known to be contaminated with any radioactive or energetic materials (*Mound Facility Physical Characterization*, 12-1-93).

9.5.3 Summary of Findings

Building DS houses metrology, receiving inspection, User Center laboratories, private industry, and laboratories in the process of Safe Shutdown. The third floor is a utility penthouse. The metrology area contains processes conventional to metrology: measurement, calibrations and testing for the following five areas: electrical, dimensional, physical, mass, and temperature. The User Center Agreement was not inspected. The building is well-maintained, with several issues of environmental concern identified during the walk-through or during review of reference materials.

9.5.4 Observations

9.5.4.1 Air Emissions

There are 28 sources listed on the checklist. Several fumehoods listed in the permit applications are no longer active. Active hoods should be evaluated to determine if they are *de minimis* and then documented as required. Permit applications have been filed with the Regional Air Pollution Control Agency (RAPCA). There is one permit associated with the building. The fumehood that is permitted is currently located in a lab that is under the User Center Agreement. Several applications were returned by RAPCA because emissions were *de minimis*. Associated documentation resides with the EG&G Technology and Monitoring Group. There are no fuel-burning units in the building. There is no evidence of fugitive dust.

Since explosive work had been performed in the building in the past, the air system should be evaluated to ensure against the presence of explosive contamination. Oversight responsibility has not been determined for leases issued under the User Center Agreement by the Department of Energy (DOE). Until this determination is made EG&G Mound is not assuming an oversight role for contractors or lessees who operate air emission sources.

9.5.4.2 Wastewater Emissions

The Mound Facility has three wastewater collection systems: a sanitary wastewater system; a storm water system; and a radioactively contaminated process wastewater system. Sanitary wastewater is treated at an onsite tertiary treatment plant and subsequently discharged by hard pipe to the Great Miami River. Storm water and any non-process wastewater, single pass cooling water, and softener backwash may be discharged directly to the Great Miami River, via the Miami-Erie Canal, or may be diverted to a 3.1-million-gallon holding pond for settling prior to discharge. Radioactively contaminated wastewater is treated in Building WD by physical-chemical treatment. If appropriate, wastewater may be discharged by hard pipe to the Great Miami River. If concentrations of radioactive contaminants cannot be reduced to acceptable levels, wastewater is solidified and shipped to the Nevada Test Site or Envirocare for disposal. All outfalls are permitted under an active NPDES permit. Routine monitoring activities are in place. Based on NPDES monitoring report data reviewed, it appears that the facility is in compliance with qualitative and quantitative conditions of the permit.

9.5.4.2.1 Sanitary Wastewater

The building has sanitary services. According to a diagram of underground utility lines, presented as Attachment 5 (Section 9.5.6.5), the building is serviced by a sanitary line. Confirmation of drainage of sanitary waste into sanitary conveyance lines was not within the scope of this effort, therefore, dye tests or smoke tests were not conducted. This building is partially leased under the User Center Agreement.

Sanitary effluent is conveyed to the onsite tertiary wastewater treatment facility, and subsequently discharged to the Great Miami River. There is no monitoring of building effluent. EG&G MAT

has no oversight role for contractors or lessees who have the ability to discharge to the sanitary and storm systems. Based on operations data, supplied by the process owner, effluent from Building DS does not deviate from that expected by the sanitary treatment plant manager.

9.5.4.2.2 Storm Wastewater

The building is also serviced by storm drains according to Attachment 5 (Section 9.5.6.5). Exterior grates and drains were not tested to confirm that they connect to the storm drainage system. Inspection showed no sign of odors, colored discharges, or scarring which would indicate that any materials other than storm water has entered the storm drainage system.

9.5.4.2.3 Chemicals

Many chemicals are stored and used in the building. A list of chemicals found in Building DS is included in the BMQ which is presented as Attachment 2 (Section 9.5.6.2). The information was gathered as part of the chemical inventory which is conducted annually. The inventory dates to 1994. Confirmation of the 1994 inventory was not attempted as 1995 data were being compiled at the time of the appraisal. It is not known what chemicals are used by lessees or contractors.

Storage, handling, and disposal of chemicals listed in the BMQ were reviewed to assure conformance to regulations related to 40 CFR 122, 40 CFR 261-265,268,265, 40 CFR 268, and 29 CFR 1910. None of the chemicals listed in the BMQ are Clean Water Act (CWA) priority pollutants. Chemical storage and handling procedures are in place for proper disposal of chemicals. There is no evidence that chemicals enter the storm or sanitary drains. There have been no reported spills from Building DS.

9.5.4.3 Potable and Service Water

Potable water is supplied to the building. Backflow prevention devices are installed at all visible points of potential cross-connection. There are two water fountains located in the building. Their location and brand names are in Attachment 1 (Section 9.5.6.1) on the EAC. The fountains which supply drinking water have not been tested for lead. According to Environmental Protection Agency (EPA) protocol, annual sampling criteria do not require testing of each fountain. There is service water supplied to the building; it is not distributed within the building.

9.5.4.4 Chemical Storage and Hazardous Materials

Chemicals used in the laboratories and associated processes are stored in Building DS. There are flammable storage cabinets which meet standard National Fire Protection Agency (NFPA) requirements. Some chemicals in the flammable storage cabinets appear to be unused and/or outdated. Nonflammable chemicals were stored in the cabinets designated for flammable chemicals. Oxygen, acetylene and other compressed gases listed in the BMQ, presented in Attachment 2 (Section 9.5.6.2), are used and properly stored and maintained. Material Safety Data Sheets (MSDS's) are available in the building, and are prominently displayed and readily

accessible to employees. Some MSDS's were not current and MSDS's from different manufacturers other than the manufacturer on the label were in use. Chemicals are stored in the building in accordance with applicable standards.

The building is equipped with appropriate emergency response equipment such as a chemical spill containment kit, eyewash, safety shower, and fire extinguisher. Fire extinguishers are bar-coded. The inspection date database is maintained in the fire station, Building 98. Inspection tags were present and current. There is an Emergency Evacuation Plan, and signs were posted in work areas.

There are no aboveground storage tanks in or around the building and no underground storage tanks are associated with this building. There are no sumps, separators, or catch basins, in or around the building.

Pipes were properly marked and signs were posted indicating the presence of asbestos.

There are no capacitors or transformers containing polychlorinated biphenyls (PCB's) located in the building (1995 Annual PCB Document Log).

9.5.4.5 Solid, Hazardous, and Radioactive Wastes

Solid wastes generated are primarily paper. There is paper, scrap metal, and aluminum can recycling to minimize solid waste. Solid wastes are removed by janitorial personnel to a site collection point, then shipped offsite to a local landfill by a contractor. Aluminum cans, glass and cardboard are removed by janitorial personnel to specific collection points, then sent offsite to be recycled by a contractor. White paper is collected, compacted and sent offsite for recycling by a contractor. Scrap metal is collected at a specific site, then sent offsite to be recycled by a contractor. Lead-acid batteries are recycled by a contractor. These service contracts are maintained by Waste Management. Classified paper is collected and taken to the Montgomery County South Incinerator by Security. There is no evidence that hazardous materials or wastes are mixed with solid waste streams.

Hazardous wastes are generated by metrology and associated procedures (*Characterization of Mound's Hazardous, Radioactive, and Mixed Waste*, 8-16-90). All hazardous wastes generated by the processes are stored in a Satellite Accumulation Area (SAA) located inside the building near to and within eye contact of the work area. The SAA procedures and appearance conform to Resource Conservation and Recovery Act (RCRA) requirements. Wastes are collected and transported by a representative of the EG&G Waste Management Group, and are stored in Building 72 for ultimate disposal. There is no onsite treatment of wastes. All are disposed of under a contract. Waste disposal manifests and Certificates of Disposal are maintained by the EG&G Waste Management Group. They conform to RCRA requirements.

9.5.4.6 Waste Minimization and Pollution Prevention

At Mound there is an active program to minimize waste streams in accordance with state and federal requirements and Executive Order 12856. Some of the processes were no longer active, therefore they were not reviewed for waste minimization or pollution prevention techniques. Programs for waste minimization in place are aluminum can, white paper, and scrap metal recycling.

9.5.5 Findings and Recommendations

Photographs were taken to document the environmental appraisal. They are included as Attachment 6 (Section 9.5.6.6). The environmental appraisal of Building DS indicates that the following action items, in priority order, should be planned and scheduled for accomplishment thus assuring that best management and operating practices are in place.

DS-1 Evaluate User Center Agreement to see if chemicals need to be identified for emergency response information. It is not known what chemicals are used by lessees or contractors.

DS-2 Evaluate User Center Agreement to determine if environmental permitting responsibilities are covered. EG&G MAT's oversight responsibility for contractors or lessees who have the ability to emit chemicals to the environment must be legally determined.

DS-3 Evaluate User Center Agreement to determine if environmental permitting responsibilities are covered. This building is partially leased under the User Center Agreement. There is no monitoring of wastewater from these laboratories.

DS-4 Evaluate air sources that are not permitted and document *de minimis* determinations in accordance with OAC 3745-15-05.

DS-5 Notify RAPCA that several hoods identified on the application are no longer active.

DS-6 Review contents in storage cabinets for compatibility requirements.

DS-7 Opportunities for waste reduction in Building DS should be considered. Review work practices.

DS-8 Evaluate the chemical inventory and remove chemicals not in use or outdated as waste in accordance with 40 CFR 261-265, 268.

DS-9 Evaluate the air vent system for explosive contamination.

Hazardous Materials (HM) Screening Checklist

Question	Response	Comments
Are any chemicals used or stored in this building, now or in the past?	Y / N	If the answer is yes, proceed with the following checklist.

HM Checklist

Regulatory Guideline	Question	Response	Comments
29 CFR 1910.1200(b,f)	All containers of hazardous chemicals shall be labeled as to the identity of the chemical and the appropriate hazard warnings.	Y (N)	MAJORITY OF CONTAINERS IN AREA ARE ID'ED the REMAINDER CAN BE ID'ED WITHIN 72 HRS.
29 CFR 1910.1200(g)	MSDS shall be available to the employees in close proximity to the work area.	Y / (N)	NOT ALL JANITORIAL CLOSETS HAD MSDSs AVAILABLE
29 CFR 1910.22, 1910.106, 1910.176	All places of employment, passageways, storerooms and service areas shall be kept clean and orderly and in a sanitary manner. Aisles shall be unobstructed. Drums and containers are not leaking and are tightly sealed.	Y (N)	W SIDE OF FACILITY IS BEING SHUTDOWN & IS EXTREMELY CLUTTERED
29 CFR 1910.106	Storage cabinets for flammable materials are constantly kept closed, are fire resistant and are labeled "FLAMMABLE - Keep Fire Away". Containers inside should be labeled and closed. No spills inside cabinet.	(Y) / N	
29 CFR 1910.106(d)(7)	Incompatible chemicals are not stored together.	Y / (N)	MULTIPLE LABS HAD AN INCOMPATIBILITY PROBLEM THIS WAS REMEDIED IN 72 HRS.
29 CFR 1910.106(d)(4)	Inside Flammable/combustible storage rooms must meet the following: 4 in. raised sill or trench that drains to a safe area, liquid tight wall/floor joints, self-closing doors, gravity or mechanical exhaust providing 6 room changes/hr., exhaust switch located outside room, at least one 3 ft. aisle; no cracks in secondary containment.	Y / N	N/A

Environmental Appraisal Checklist

Building Name: DS

Date: 2/19-20/96

HM Checklist

Regulatory Guideline	Question	Response	Comments
29 CFR 1910.106(d)(7)	All flammable/combustible storage locations have at least one 12-B portable fire extinguisher located outside and within 10 ft. of a door opening into any room for storage. No smoking signs are posted.	Y / N	N/A
29 CFR 1910.151	Eyewashes/showers shall be provided within the work area. Ensure unit is operational.	(Y) / N	
CGA P-1 3.3 & 3.3.10	All gas cylinders (full or empty) shall carry a legible label or marking identifying the contents.	Y / (N)	VARIOUS LABS NOT IN COMPLIANCE PROCESS MAR CORRECTING
CGA P-1 3.5.3	Full and empty containers should be stored separately with the storage layout planned so that containers comprising of old stock can be removed first with a minimum handling of other containers.	Y / (N)	EMPTY VS FULL CONTAINERS NOT ALWAYS SEGREGATED
CGA P-1 3.5.8	All compressed gas containers in service or in storage shall be stored standing upright and the container shall be secured.	(Y) / N	
CGA P-1 4.2.2	Oxygen cylinders shall be separated from flammable gas containers or combustible materials a minimum of 20 ft. or a noncombustible barrier 5 ft. high.	Y / N	N/A
29 CFR 1910.104(2)(10)	Oxygen stored as a liquid shall be on a noncombustible surface. Asphalt is considered combustible. Wood and long dry grass shall be cut back 15 ft. from the container.	Y / N	N/A
29 CFR 1910.104	Bulk oxygen storage shall be permanently placarded "OXYGEN - NO SMOKING - NO OPEN FLAMES".	Y / N	N/A
	Is there a sign posted in each work area regarding emergency egress and emergency response action?	(Y) / N	
	Is there an emergency response plan available?	(Y) / N

RCRA Screening Checklist

Does this facility generate waste or use chemicals?	(Y) / N	If yes, conduct the following survey.

RCRA Checklist

Regulatory Guideline	Question	Response	Comments
OAC 3745 52-11	Has any material generated been characterized RCRA hazardous? Was characterization by analysis or by process knowledge? Are lab results or documentation of process knowledge readily available? Note any uncharacterized material in comment section. Is it waste? If yes, proceed with next section.	(Y) / N analysis / process (Y) N (Y) N	BUT NOT ON ALL CONTAINERS SEVERAL CONTAINERS (SMALL WILL NEED CHARACTERIZATION)
OAC 3745 52-11	Are any of the materials noted RCRA hazardous waste? If no, note and stop here. If yes, note the location of the management unit, and the method of management, and proceed with the appropriate section below.	(Y) / N	

Environmental Appraisal Checklist

Building Name: DS Appraisers: Terry Glander, Mary-Louis Hoagland, John Puckett, Mary Sizemore Date: 2/19-20/96

RCRA Checklist

Regulatory Guideline	Question	Response	Comments
I. HAZARDOUS WASTE STORED IN CONTAINERS			
	Is there an area in the building that could qualify as a Satellite Accumulation Area?	(Y) / N	DS 258, 243, DS 127A are examples.
	Is it treated as such?	(Y) / N	
OAC 3475-52-34 (C)	Has any of the RCRA hazardous waste in this building been managed in Satellite Accumulation Areas? If no, proceed to the next section. If yes, answer the following.	(Y) / N	
	Are the containers marked with the words hazardous waste, or other words denoting the hazard?	(Y) / N	
	Are the containers in good condition?	(Y) / N	
	Are the waste compatible with the containers?	(Y) / N	
	Are containers managing ignitable hazardous waste stored at least 50 feet from the plant site boundary?	(Y) / N	
	Are containers kept closed and locked except during filling?	(Y) / N	
	Are containers moved within 3 days of being filled?	(Y) / N

9.5-26

RCRA Checklist

Regulatory Guideline	Question	Response	Comments
OAC 3745-52-11 (A)	If a Satellite accumulation area has been abandoned and/or if waste left in place, and the containers may be subject to the 90-day-storage exclusion. If this exclusion does not apply, go to the next section. If the containers have been in storage under this exclusion, answer the following:		N/A
	Are the containers in good condition?	Y / N	
	Are the waste compatible with the containers?	Y / N	
	Are the containers kept closed except during filling?	Y / N	
	Are the containers managed in such a way, that they are not ruptured, or leaks caused?	Y / N	
	Is the area inspected at least once weekly?	Y / N	
	Is the inspection recorded? Where is the log? Is it properly completed, dated, and signed?	Y / N Y / N	
	• Are containers managing ignitable hazardous waste stored at least 50 feet from the facility boundary?	Y / N	
	Are incompatible wastes managed in such a way that they will not react with another incompatible waste?	Y / N	
OAC 3745-52-34(B)	Has any of the waste (except in Building 23, Building 72 and the Burn Area) been managed in excess of 90-days?	Y / N	
	If no go to next section.		
	If yes, note.		
	For Building 23, Building 72 & Burn Area use special checklist.		

Environmental Appraisal Checklist

Building Name: DS

Appraisers: Terry Glander, Mary-Louis Hoagland, John Puckett, Mary Sizemore

Regulatory Guideline	Question	Response	Comments
II. HAZARDOUS WASTE STORED IN TANKS			
OAC 3745-52-32 (B)	Has any chemical waste stored in a tank, piece of process equipment or ancillary equipment been in storage in excess of 90-days?	(Y) / N	
	If the answer was no, then proceed with the following:	Y / N	
	Has the tank or piece of equipment had an integrity assessment?	Y / (N)	
	Is there a sump?	Y / (N)	
	Is it dry?	Y / N	N/A
	Does the tank or equipment have secondary containment?	Y / (N)	
	Does the tank or equipment have leak detection device(s)?	Y / N	N/A
	Has spill control prevention been enacted?	Y / N	N/A
	Has any hazardous waste stored in a tank, piece of process equipment or ancillary equipment been in storage in excess of 90-days?	(Y / N)	POSSIBLY THIS NEEDS FURTHER INVESTIGATION DUE TO SAFE SHUTDOWN MODE AND USER AGREEMENT.
	If the answer was no, then proceed with the following:		
	Has the tank or piece of equipment had an integrity assessment?	Y / N	
	Does the tank or equipment have secondary containment?	Y / N	
	Does the tank or equipment have leak detection device(s)?	Y / N	
	Has spill control prevention been enacted?	Y / N	
	Is there a closure plan?	Y / N	
	If yes, then note.		
OAC 3745-67	Has any of the waste been managed in a surface impoundment? If yes, then note. Go to the next section.	Y / (N)

Asbestos Screening Checklist

Does this facility contain ACBM?	(Y) / N	If yes, conduct the following survey:

Asbestos Checklist

Note: Routinely, the asbestos standard for ACBM in schools has been applied to facilities for purpose of cleanup. In addition to AEHERA, there are additional standards in the NESHAPS that may be of importance.

Regulatory Guideline	Question	Response	Comments
ADAPTED FROM TSCA ACBM IN SCHOOLS:			
	Has this building been characterized either through process knowledge, by analyses, or by inspection to determine if it contains asbestos? If no for this building or area note this conclusion in the comment section.	(Y) / N	INSPECTION AND ANALYSIS
	Is there any evidence of friable asbestos?	Y / (N)	
	Is the asbestos removal properly managed? (See questions listed below)	Y / N N/A	If there is no asbestos removal, do not complete the following section.
NESHAPS FOR ASBESTOS FOR ANY ONGOING ASBESTOS REMOVAL:			
40 CFR 61.156	There are no discharges of visible emissions to the outside air from collection, processing, packaging, transporting, or deposition of ACBM during the removal.	Y / N	
40 CFR 61.152(b) (1)	ACBM is treated with water in accordance with 40 CFR 152(b)?	Y / N	
40 CFR 61.154	Is friable asbestos adequately wetted during stripping? Or, has an adequate ventilation and collection system been installed?	Y / N	
40 CFR 61.152	Is wetting continued until the waste friable asbestos is collected for disposal?	Y / N

Toxic Substances and Control Act (TSCA) PCB's Screening Checklist

Does this facility potentially contain any PCB's or PCB contaminated equipment?	Y / N	If yes, are transformers labeled (Blue) or Yellow stickers)? If yes, conduct the following survey.

TSCA Checklist

Regulatory Guideline	Question	Response	Comments
40 CFR 761	Has any waste generated in, or from, this building been characterized either through process knowledge or by analyses to determine if it contains PCB's ? If the answer is no, note . If the answer is yes, proceed with next section.	Y / N	
	Based on an inspection, are any of the materials or equipment potentially PCB contaminated? If no, note and stop here. If yes, note the location of the management unit, and the method of management, and proceed.	Y / N	
40 CFR 761.65 (c) (5)	Are PCB articles or containers stored in this building checked for leaks at least once every 30 days?	Y / N	
	If yes, are auditable records maintained.	Y / N	
40 CFR.30 (a) (1) (ix)	Are any PCB transformers in use, or stored for possible reuse, that contain PCB's at concentrations of 500 ppm or greater?	Y / N	
	Are they visually inspected quarterly? If yes, are auditable records maintained?	Y / N	

Building Name: DS

Appraisers: Terry Glander, Mary-Louis Hoagland, John Puckett, Mary Sizemore

Date: 2/19-20/96

TSCA Checklist

Regulatory Guideline	Question	Response	Comments
40 CFR 761.30 (a) 1,viii	Are all combustible materials (i.e., paints, solvents, plastics, paper, sawn wood, etc.) cleared from areas containing PCB transformers to a distance of five meters?	Y / N	
40 CFR 761.65 (b) (8)	Are all PCB articles and containers labeled with the date they were placed in storage?	Y / N	
	Are labeled PCB articles and containers stored so that the labels can be referenced?	Y / N	
40 CFR 761.65 (a)	Are all PCB's and PCB contaminated items at concentrations above 50 PPM, that are stored for disposal, stored no longer than one year from the date they were placed in storage?	Y / N	
40 CFR 761.62 (b) (1) (i)	Do all PCB storage areas have an adequate roof and walls to prevent rainwater from reaching the stored items?	Y / N	
40 CFR 761.62 (b) (1) (iv)	Are storage are floors curbed and constructed of continuous smooth and impervious materials?	Y / N	
40 CFR 761.62 (b) (1) (i)	Are the curbs at least 6 inches high?	Y / N	
40 CFR 761.62 (b) (1) (iii)	No drains are allowed in storage areas. Are there drains in the storage areas?	Y / N

Low-Level Waste and Transuranic Waste Screening Checklist

Does this facility contain radioactive waste ?	Y / (N)	If yes, conduct the following survey:

Low-Level Waste and Transuranic Waste Checklist

Regulatory Guideline	Question	Response	Comments
Low-Level Waste			
DOE Order 5820.2A Chapter III	Can any waste generated in, or from, this building be characterized either through process knowledge or by analyses to determine if it is LLW ? If the answer is no, note. If the answer is yes, proceed with next section.	Y / N	
DOE Order 5820.2A Chapter III.	Are any of the materials noted by inspection LLW? If no, The audit would stop here, because there are no LLW. If yes, note the location of the management unit, and the method of management, and proceed with the section below.	Y / N	
DOE Order 5820.2A Chapter III, 3.a.	Have the storage configurations in use in this area been taken into account for keeping external exposures to the general public below 25 mrem/yr?	Y / N	
	Is the waste stored in a configuration that protects ground-water resources?	Y / N	
DOE Order 5820.2A Chapter III, 3.b.	Has monitoring been conducted in this area in accordance with DOE Order 5820.2A in order to evaluate the area against the performance standard?	Y / N	
	Based on field data, does the monitoring conducted in this area conform to the performance standard?	Y / N

Low-Level Waste and Transuranic Waste Checklist

Regulatory Guideline	Question	Response	Comments
DOE Order 5820.2A, Chapter II 3.e	Has the TRU waste been segregated in manner that will not permit commingling of TRU waste with LLW or high-level waste?	Y / N	
	Has the TRU waste been protected from unauthorized access?	Y / N	
	Has the TRU waste been monitored periodically to ensure that it is not releasing its radioactive and/or hazardous constituents?	Y / N	
	Has this TRU waste storage area been designed, constructed, maintained, and operated to minimize the possibility of fire, explosion, or accidental release of its radioactive and/or hazardous constituents?	Y / N	
	Does the facility have a contingency plan designed to minimize the adverse impacts of fire, explosion, or accidental release of its radioactive and/or hazardous constituents?	Y / N	

GENERAL COMMENTS:

Waste Minimization/Pollution Prevention Activities Screening Checklist

Does this facility generate waste or use chemicals?	(Y) / N	If yes, conduct the following survey.

Waste Minimiaztion/Pollution Prevention Activities Checklist

Regulatory Guideline	Question	Response	Comments
	Based on available information and a walk through, are there any apparent opportunities to curtail the consumption of raw materials (including but not limited to paper, chemicals, electricity, and etc.). If yes, list candidate areas in the comment section.	(Y) / N	SAFE SHUTDOWN NEEDS TO EVALUATE WASTE MIN OPPORTUNITIES IN AREAS OF LEAD RECYCLING, BRASS, ETC. DUE TO THE USER AGREEMENTS IT CAN NOT BE FULLY DETERMINED WHAT CHEMICALS ARE
	Are there solvent wastes?	(Y) / N	LEFTOVER ACETONE ONLY
	Is vehicle maintenance performed?	Y / N	N/A
	Are oils used ?	(Y) / N	VACUUM PUMPOILS
	Are these corrosive wastes?	(Y) / N	FERRIC CHLORIDE
	Are there sludges?	Y / (N)	
	Are there halogenated organic (nonsolvent) wastes?	Y / (N)	
	Are metals recovered from wastewater?	Y / (N)	
	Is waste sludge generated?	Y / (N)	
	Are any waste minimization practices used that reduce the generation of sludge?	Y / N	N/A
	Ion exchange process?	Y / N	
	Lead in gasoline lowered to reduce tank sludge toxicity?	Y / N	
	Storage tank agitators installed?	Y / N	
	Corrosive resistant materials used?	Y / N	
	Prevention of crude oil oxidation ?	Y / N	
	Drying?	Y / N

9.5.6.2 Building Manager's Questionnaire

Building Manager's Questionnaire

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

1. What are the access requirements (training, clearance, etc.)?

2. What protective equipment is required to enter the building?

PPE IN VARIOUS LOCATIONS

3. Are there any restricted areas? Yes (No)
   Where are they?

4. Provide a physical description of the building.

Building DS is constructed of reinforced concrete and concrete blocks. The roof is BUM (asphalt). Total area is 47,800 ft². HVAC systems are central steam and chilled water. Asbestos has been found in the building. Building is not known to be contaminated with any radioactive ~~or energetic materials~~, although both types have been handled in the building. ← DS must be sanitized to 3X level by 9/3

Source: Mound Facility Physical Characterization, 12-1-93

5. Provide a drawing of the building.

Attached

6. What is the current building use?

Building is used for metrology studies ~~and energetic materials production and development~~. and DOE User Center or Space to MMCIC and Stat SAFE Shutdown Activities

Source: Mound Buildings, 5-9-95

7. What is the history of building use other than that described in #6?

Source: Mound Buildings, 5-9-95

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

8. What are ongoing operations or processes? What are the raw materials and waste streams from each process? Who is the best contact for each process?

Process(es) Housed: Tape processing, slapper detonator development, process technology development, welding technology, off schedule production, energetic component development, low energy component development, x-ray processing, final acceptance, IMPAC, material handling, metrology

How Wastes Are Generated:

Tape Processing: Photoresist is put on a 250-ft roll of copper tape. A mask then covers part of the tape. The tape is exposed to ultraviolet light which hardens the unmasked photoresist. A dilute solution of Na_2CO_3 is used to remove the unhardened photoresist. This solution is flushed down the drain. The tape is passed through a ferric chloride solution to etch it. A dilute solution of KOH is then used to remove the hardened photoresist. The KOH solution is also washed down the drain.

Ferric chloride is handled as follows: A 55-gal drum of fresh solution is brought into the room where the processing machine is used. Seventeen gallons of ferric chloride is pumped into the machine. After 750 ft of tape are processed, the ferric chloride solution is pumped out of the machine and into a waste drum. The 17-gal tank in the machine is then filled with water, and the water is pumped into the waste drum. The tank is filled with water once again, and this water is flushed down the drain.

The tape then moves to the nickel plating room. Tape is put into the plater, which is connected to tanks containing three different materials: nickel sulfamate/water/boric acid solution, water, and sulfuric acid/water solution. First the delivery line is flushed with water, and that water goes down the drain. Sulfuric acid is used to clean the tape and is returned to its container. The delivery line is again flushed with water which goes in the drain. Nickel sulfamate solution is delivered to the tape, and some nickel is plated out. The solution is returned to its container. The line is flushed with water which is collected in a 15-gal waste drum.

Wastes from the plating operation are spent nickel sulfamate solution and water, dirty sulfuric acid (tank of acid is changed two or three times a year, depending on volume of production), and nickel cleanup waste, which includes any papers used to clean up spills.

Next, a bridge is bonded to the tape. HCl and ethyl alcohol are used to clean these two parts. Both cleaning agents are used in small quantities and are flushed down the drain.

Throughout the process, alcohol may be used to wipe the tape, but the alcohol evaporates, and there is no liquid waste to dispose of.

Current plans call for moving the production portion of tape processing to the basement of Building COS. The development portion will remain in DS. After the move is completed, ferric chloride may be

replaced with cupric chloride which can be regenerated with HCl. Cupric chloride can be reused. Some excess cupric chloride will be generated and will need to be disposed of.

Slapper Detonator Development: This work occasionally requires use of the tape processing equipment described above. Additional potentially hazardous materials are 50% HCl solution which is collected in waste cans for Waste Management to pick up; ethyl alcohol which is used for cleaning and, if used in significant quantities, is put in waste cans; nickel sulfamate and gold cyanide solutions which are used for plating nickel and gold on the tape and are collected in waste cans for disposal; acetone which is used in small quantities for cleaning and quickly evaporates; and small quantities of explosives (PETN, HMX, LX-16) whose wastes are put in "Explosive Waste" containers.

Process Technology Development: This group works on film fabrication and surface modification using both physical and chemical means at a variety of temperatures and pressures. They use small amounts of various chemicals. There is no significant waste stream.

Welding Technology: Acetone and 200-proof ethyl alcohol are used for wiping parts clean. The solvents evaporate. There is no hazardous waste stream.

Off Schedule Production: In this operation, orders for small numbers of parts are filled. The wastes include small amounts of explosive wastes which are sent to the burn area on site for destruction, hardened epoxies which go in a trash can, and solvents used for cleaning parts in an ultrasonic bath. The solvents used are Freon TF, tricholorethane, and ethyl alcohol. They are piped into the room, and spent solvents are poured into a sink which drains to a waste drum in the DS solvent shed.

Energetic Component Development: Secondary explosives are used in this work in small quantities. Explosive wastes in the form of paper, cloth, etc., contaminated with traces of explosives are put into lined containers which are emptied when they are about half full or contain about a gram of explosive. Wastes removed from the containers are packaged, labeled, and sent to the on-site burn area for destruction. Pieces of explosive which are to be discarded are packaged, labeled, and stored in a service bunker until they can be taken to the burn area. Solvents used in these labs are generally in squeeze bottles. They evaporate quickly and there is no liquid waste. Solvents include isopropyl alcohol, ethyl alcohol, acetone, toulene, Freon, and trichloroethane. Occasionally, Freon TF is used in a bath for high voltage testing, and ethylene glycol is used to make a black ink required to locate deviations from the desired surface contour for some parts. Wastes from these operations are put in cans for Waste Management to pick up.

Low Energy Component Development: Energetic components are fabricated using pyrotechnics and primary, secondary, and special explosives. Explosive wastes are put in marked containers and eventually sent to be burned on site. Ethanol and acetone are occasionally used for cleaning. The solvent is put on a Kimwipe which is then used to clean

the part. The solvent evaporates and the Kimwipe is put in the trash or explosive waste. No liquid hazardous wastes are generated.

X-Ray Film Processing: The x-ray film development in Building DS is done with a Hope model processor which uses Kodak chemicals (Kodak Industrex Developer and Replenisher, Kodak Industrex Fixer and Replenisher, Kodak Liquid Developer System Cleaner, and Kodak Fixer Wash System Cleaner). These chemicals are collected in a waste can for pickup by Waste Management. In February (1990) a new Fuji processor replaced the Hope model. Different chemicals are to be used, and Waste Management will help plan for waste disposal.

Metrology may generate 1 gal of solvent waste, primarily acetone, each year.

Final Acceptance, IMPAC, and Material Handling generate no hazardous wastes.

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

20. Has there been a reported spill, leak, or other release of any chemical? Yes No
What, how much, and what clean-up measures were followed?

Chemical	Amount	Clean-up Measures

Source: _____

21. Where do waste chemicals go?

22. What janitorial supplies are stored inside or outside of the building?

23. Where do excess janitorial supplies go?

Source: _____

24. Are pesticides or herbicides stored or used in or around the building? Yes No ?

Chemical	Amount	Chemical	Amount

Source: _____

Building Manager's Questionnaire

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

25. Does the building contain active or inactive above ground storage tanks? Yes No
For each tank, list the content, quantity, last inspection, registration number.

Registration Number	Content	Quantity	Last Inspection Date	Preventive Maintenance Performed	Inside Or Outside
68476-34-6	DIESEL FUEL	30 GAL		Y/N	
7697-37-2	NITRIC ACID	01 C		Y/N	
7440-37-1	ARGON	01 C		Y/N	215
7440-37-1	ARGON	02 C		Y/N	206
7440-37-1	ARGON	01 C			135
7440-37-1	ARGON	01 C			123
7664-93-9	SULFURIC ACID	01 C			132
7782--37-9	NITROGEN	03 C			135
7782-37-9	NITROGEN	04 C			135
7782-37-9	NITROGEN	02 C			135

7782-37-9	NITROGEN	01 C			135
7782-37-9	NITROGEN	04 C		Y/N	Outside

Source: Emergency and Hazardous Chemical Inventory Form - Chemical Storage Tanks on EGG Mound Site Owned and Maintained by Outside Contractors 8/8/94

26. Is there a sump or pit or underground tank in or around the building?
Yes No Unknown
Is it double-walled? What does it contain? How many days per year is it filled?
Is there an emergency overflow tank? Have there been previous overflows?

Double-Walled	Contents	Days/Year in Use	Overflow Tank	Previous Overflow
Y / N			Y / N	Y / N

Source: _____

27. Does the building generate, store, or dispose of hazardous waste? Yes No

Building Manager's Questionnaire

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

28. Does the building have abandoned process equipment such as tanks, piping, containers, etc.? Yes No

29. Is waste material stored in or around the building for more than 90 days?
Yes No

30. Has the building been identified as a 90-day waste accumulation area?
Yes No

31. Has any area in the building been identified as a satellite accumulation area?
Yes No

32. Is mixed waste generated, stored, or disposed of from the building? Yes No
Where are logs found?

Process	Waste	Stored	Disposed	Logs
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N

Source: _____

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

33. Is TRU radioactive waste generated, stored, or disposed of from the building?
Yes (No)
Where are logs found?

Process	Waste	Stored	Disposed	Logs
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N

Source: _____

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

34. Is low-level radioactive waste generated, stored, or disposed of from the building? Yes No
Where are logs found?

Process	Waste	Stored	Disposed	Logs
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N
		Y / N	Y / N	Y / N

Source: _____

35. Identify all administrative orders, temporary or permanent injunctions, civil administrative penalties, or criminal activities issued against the building.

Building Name: DS Building Manager: J.L. Boston Phone: _____ Date: 12-07-95
Alternate: _____ Phone: _____

36. Is there a waste minimization program in the building? Yes No
Discuss your ideas about how to minimize waste.

37. Has a pollution prevention program been developed for the building? Yes No

COMMENTS: Please see Attached for Tritium swear results

NOTES:
1. See MD-80036 10002 for calculations of WB, extremity and skin dose rates.
2. To request RO Count Room analysis for β/γ, alpha or tritium, leave column blank. Mark column N/A if not needed. If count room printout of results are attached, write "see attached" in column.
3. Annotate special sample type (e.g., soil, water), special identifiers or otherwise in Comments. If not needed, mark N/A.

Contamination Found in DS Building

DS Building is a 47,810-ft2 building used for metrology, explosives production, and development in support of defense programs. For the purpose of Site Characterization, surveys began on October 22, 1996. The survey protocol is based on the DOE-MB Radiological Protection Position Determination, Release of Materials, May 1, 1996.

Item Number	Date	Room	Item Description	Levels (dpm/100 cm2)	Status
1	11/05/96	221A	Cabinet shelf	2.9 million dpm; tritium	Room posted as Controlled Area/RBA/RMA cabinet posted as High Contamination Area
2	10/29/96	218	Channel Locks (first item found)	3000 dpm alpha - fixed	Bagged/tagged - moved to RMA in M- Bldg.
3	10/29/96	215	Punch Press	2,378 dpm tritium	Room posted as Controlled Area and RMA.
		215	Rotary Motor	800 dpm alpha - fixed	same as above
	10/29/96		100% survey of lab and process equipment		
4	11/5/96	212	Box of electrical tools	20,000 dpm tritium	Bagged/tagged - moved to RMA in 221A
5	10/14/96	123	6000 gauges were being surveyed for release by Rad Ops. 1 of 458 (sampling size)	2,200 dpm tritium	Item re-surveyed. Results less than 1000 dpm. Lot released.
6	11/05/96	201	Sources in switches. Part of equipment.	Cs-137; Ni-63	Bagged/tagged - moved to RMA in 221A
7	11/07/96	205	Test circuit board	107,238 dpm tritium	Bagged/tagged - moved to RMA in 221A (Originally in rm. 126)
8	11/06/96	209	Metal stand - Counter Lab type	10,000 dpm tritium	Bagged/tagged - moved to RMA in 221A
9	11/07/96	201	Feather duster/foxtail brush	1,271 dpm tritium	Bagged/tagged - moved to RMA in 221A

Item Number	Date	Room	Item Description	Levels (dpm/100 cm2)	Status
10	11/07/96	126A	pH Probes - 4	2,400 dpm beta/gamma	Sent to gamma spec.
11	11/11/96	205	Metal cart	651 dpm; alpha; fixed	Bagged/tagged - moved to RMA in 221A
12	11/12/96	221F	Counter top	1528 dpm; alpha; fixed 123 dpm; beta; fixed	Posted counter as Controlled Area/RMA
13	11/12/96	221C	Welding electrode	6159 dpm; beta; fixed 424 dpm; alpha; fixed	Sent to gamma spec. Gamma spec determined tungsten.
14	11/13/96	221B	Wooden crate	2127 dpm; tritium	Moved to 221A
15	11/13/96	135	Four filaments	2700 dpm alpha; fixed 6000 dpm; beta; fixed	Gamma spec determined tungsten and 72 dpm alpha loose due to Th-232.
16	11/13/96	135	Power supply	2176 dpm, tritium	Bagged/tagged - moved to 221A
	11/14/96		Instructed to post DS Bldg.		
17	11/14/96	135	Trash can	1010 dpm tritium	Bagged/tagged - moved to 221A
18	11/14/96	224	Box of metal parts	2070 dpm tritium	Re-survey individual components
19		226	Roll around cart	2819 dpm; beta; loose	Wrapped/tagged - moved to 221A; evaluating post
20		226	Two power cords	1729 dpm; tritium	Bagged/tagged - moved to 221A
21	11/18/96	224	Re-survey of individual components in box of metal parts - 15 items	105,858 dpm; tritium - highest	Bagged/tagged to be moved to 221A; room is 100% surveyed
22	11/18/96	226	Regulator	1729 dpm; tritium	Bagged/tagged - moved to 221A
23		226	Power Supply	3185 dpm; tritium	Bagged/tagged - moved to 221A
24	11/26/96	106	500 lb weights - 2	147 dpm & 102 dpm; alpha; fixed	Labeled as FCA.

Item Number	Date	Room	Item Description	Levels (dpm/100 cm2)	Status
25	12/04/96	103	Two drawers from two different cabinets.	1- 1,333 tritium - loose 2 - 22 dpm alpha - loose	Drawers bagged/tagged - moved to 221 A. The count room results for the drawer with alpha was < 20 dpm.
26	12/04/96	103	Two drawers from two different cabinets.	1 - 1,940 tritium - loose 2 - 26 dpm alpha, loose and 398 fixed alpha	Drawers bagged/tagged - moved to 221A.
27	12/04/96	109B	Cabinet door	1,000 dpm alpha - loose 8,768 dpm alpha - fixed 1,090 dpm beta - fixed	Smear was alpha & gamma spec. indicating Am 241 and Pu 238. Door has been removed, bagged/tagged - moved to 221A.
28	12/04/96	109B	Box of standards - weights.	200 dpm alpha - fixed 3,000 dpm beta - fixed	Bagged/tagged - moved to 221A.
29	12/09/96	109C	Floor	10,804 dpm tritium - loose	Posted as contamination area. Decon and deposited.
30	12/09/96	109C	Metrology scale	409 dpm alpha - fixed	Bagged/tagged - moved to 221A.
31	12/09/96	133	Photometer	41,000 dpm beta - fixed	Bagged/tagged - sent to gamma spec.
32	12/10/96	109B	Cabinet drawer	2,392 dpm - tritium	Bagged/tagged - moved to 221A
33	12/16/96	109C	Mettler scale	2,333 dpm - tritium	Bagged/labeled/posted RMA
34	12/17/96	110	Floor	1,114 dpm - tritium	Posted as CA
35	12/19/96	110	Keyboard	1,758 dpm - tritium	Bagged/tagged - moved to 221A
36	01/07/97	107	Wooden Box Top	150 dpm alpha - fixed	Bagged/tagged - moved to 221A
37	01/13/97	107A	Floor	1,000 dpm - tritium	Posted as CA
38	01/22/97	125	Metal and plastic assembly	1,095 dpm - tritium	Bagged/tagged - moved to 221A
39	01/22/97	125	Bulletin Board	5,274 dpm - tritium	Posted as CA
40	01/29/97	111	Floor	4,072 dpm - tritium	Posted as CA

Item Number	Date	Room	Item Description	Levels (dpm/100 cm2)	Status
41	01/29/97	116	Floor	4,648 dpm - tritium	Posted as CA
42	02/03/97	118	Computer monitor	350 dpm alpha - fixed	Tagged - moved to 221A
43	02/04/97	127A	Trash can	2,415 dpm - tritium	Bagged/tagged - moved to 221A
44	02/04/97	214	Plexiglass shelving	2,056 dpm - tritium	Bagged/tagged - moved to 221A
45	02/04/97	217	Constant Temp. Chamber	9,177 dpm - tritium	Posted as CA
	02/05/97	217	Re-survey of Constant Temp. Chamber	116,083 dpm - tritium	Previously posted as CA
46	02/05/97	214	Door handle	2,498 dpm - tritium	Posted as CA
47	02/05/97	222	Cabinet	12,801 dpm - tritium	Posted as CA
48	02/05/97	222	Air supply vent	5,000 dpm - tritium	Posted as CA
49	02/05/97	222	Floor	4,818 dpm - tritium	Posted as CA
50	02/10/97	220	Floor	18,478 dpm - tritium	Posted as CA
51	02/10/97	119A	Floor - Broom closest	1,241 dpm - tritium	Posted as CA
52	02/10/97	223	Floor	23,331 dpm - tritium	Posted as CA
53	02/13/97	235	Step stool	1,913 dpm - tritium	Moved to 221A
54	02/13/97	250	Computer software	30 dpm - alpha loose	Posted as CA
55	02/13/97	250	Bags of waste - 11	330 dpm - alpha loose	Posted as CA
56	02/18/97	250	Trash can	1,345 dpm - tritium	Posted as CA
57	02/18/97	251	Floor	40 dpm alpha - loose	Area posted as CA
58	02/18/97	251	Bottom of Scale	300 dpm alpha - fixed	Within previously posted area

P.O. Box 3000
Mound Road
Miamisburg, OH 45343-3000

Dear Mr. Murphy:

I have enclosed the results ~~of the radon~~ measurements made at your site as part of the DOE Indoor Radon Study. A copy of these results can be provided in electronic ~~format if desired~~. The results will be forwarded to the study sponsor, the DOE Office of Projects and Facilities Management, by the end of April.

Please contact me at FTS 326-6293 or commercial (303) 248-6293 if you have any questions.

Sincerely yours,

Mark D. Pearson

I certify that the data presented as part of this report meets the minimum quality assurance standards specified in the referenced analytical method(s). Based on my review of the data, I believe that the submitted information is true, accurate, complete and meets the minimum standards specified in 40 CFR 136, 40 CFR 763, and/or SW-846. Any exceptions encountered in the analysis of samples contained within this report have been noted and an assessment of the quality of the data is presented. I am aware that there are significant penalties for submitting with knowledge, false information, including the possibility of fines and/or imprisonment.

Appendix L

Noted Soil Sampling, Vicinity

Appendix L (basic) sampling that exceeds *comparison values* are so noted on the spread sheet in the right-most column and with **bold** numbers in the "Measured Value" column. The constituent of concern can then be addressed in the Parameter Name attachment to the appendix. This attachment lists *comparison values* in its right-most column, and reference sources in its left-most column.

1 Value is 10-6 Risk-Based Guide Value
2 Value is OU9 Soil Background Value
3 Value is other criteria, I.e. 5 pCi/g for certain radionuclides
25 pCi/g plutonium
5 Value is MCL
6 Value is the Guide Value based on the hazard index

11. SUBJECT OR TITLE OF OCCURRENCE:
DS BUILDING - BUILDING EVACUATION
GROUP 1 - FACILITY CONDITION SUBSET I - OFF-NORMAL - SUB PARAGRAPH (F)

12. DESCRIPTION OF OCCURRENCE:
DS BUILDING RECEIVED AN INADVERTENT EVACUATION SIGNAL DURING TESTING OF THE ADT ALARM SYSTEM IN ANOTHER AREA OF THE PLANT. DS BUILDING OPERATIONS WERE IN NORMAL MODE AT THE TIME OF THIS OCCURRENCE. THERE WERE NO INJURIES OR ENVIRONMENTAL RELEASE ASSOCIATED WITH THIS INCIDENT; IT DID NOT DIRECTLY DEGRADE ANY SAFETY OR PRODUCTION SYSTEM; THERE IS NO PUBLIC INQUIRY, CONGRESSIONAL INQUIRY OR PRESS RELEASE PLANNED.

13. OPERATING CONDITIONS OF FACILITY AT TIME OF OCCURRENCE:

NORMAL OPERATING CONDITIONS

14. IMMEDIATE ACTIONS TAKEN AND RESULTS:

THE BUILDING EVACUATION TOOK PLACE AS EXPECTED ACCORDING TO PROCEDURE.

[ ] DAILY [X] OCCURRENCE REPORT [ ] PI (Internal Dist. Only)

OCCURRENCE REPORT NUMBER: EGGMAT-EX-91-01 | REPORT DATE: 04/12/91

15. CAUSE:

The OS (Development and Standards) Building requires automatic evacuation on any fire alarm. Initially, it was believed that this inadvertent alarm was associated (electronically) with the testing of the fire alarm in another area of the plant. Upon further investigation, it was determined that the alarm sounded coincident with the test of the plant fire pump. This pump is operated for 30 minutes every week. On this particular occasion, the flow of water was greater than normal causing the alarm to go off.

Direct Cause: (mark only one)
[ ] Design [ ] Material [ ] Personnel [X] Procedure [ ] Other
EXPLAIN:

The plant fire pump is tested each week normally with no impact on the plant. On this occasion the OS building water flow alarm activated the fire alarm bells in the OS Building. The alarm sounded due to a greater than 30 second surge in water flow.

Contributing Cause(s): [ ] Design [ ] Material [ ] Personnel [X] Procedure [ ] Other
EXPLAIN:

The Fire Department was evaluating letting the plant fire pump establish a differential pressure across the alarm check value, after water flow alarm tests had equalized those pressures earlier in the week.

Root Cause: [X] Procedure [ ] Training [ ] Management [ ] Personnel [ ] Design [ ] Material

The failure to make a precautionary announcement of the fire pump test while evaluating the weekly fire pump test with no pressure differential on the alarm check valve dictated the evacuation of the OS building.

---

16. DESCRIPTION OF CAUSE:

OS Building was evacuated because the fire alarm was activated. This occurs when water flow and surging lasts longer than allowed by alarm system check valve.

---

17. EVALUATION:(By Facility Manager)

There was no pcogrammatic impact to the plant as a result of this incident. The building evacuation took place in accordance with standard procedures. The investigation is continuing to determine contributing and root causes.

---

18. IS FURTHER EVALUATION REQUIRED: [ ] YES [X] NO

IF YES, BEFORE FURTHER OPERATION: [ ] YES [X] NO

IF YES, BY WHOM? _____

WHEN? _____

[ ] DAILY [x] OCCURRENCE REPORT [ ] PI (Internal Dist. Only)

OCCURRENCE REPORT NUMBER: EGGMAT-EX-91-01 | REPORT DATE: 04/12/91

19. CORRECTIVE ACTION:

1) Change procedure to achieve the pressure differential by use of the plant fire pump or jockey pump, in conjunction with water flow alarm tests.

[X] Taken [ ] Recommended [ ] To be supplied

20. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH:

No environmental, safety and health impact.

21. PROGRAMMATIC IMPACT:

No programmatic impact.

22. IMPACT UPON CODES AND STANDARDS:

No impact upon codes and standards.

23. FINAL EVALUATION AND LESSONS LEARNED:

The method previously used to establish pressure differential was accomplished by closing a manual drain valve as rapidly as possible. The flowing water inertia (abruptly stopped) results in a higher pressure down stream of the alarm check valve. This is not a desirable procedure because; 1) it causes water hammer throughout the sprinkler system and 2) it is physically difficult to perform. In this incident the fire department was evaluating what would happen if there were no pressure differential. This inadvertent evacuation could have been avoided if an announcement was made to "disregard alarm bells". It is obvious from this incident that the pressure differential must be maintained and that a better procedure was required. The new method for maintaining the pressure differential is to use the plant fire pump or jockey pump.

13. SUBJECT OR TITLE OF OCCURRENCE:
Actuation of Safety System

---

14. NATURE OF OCCURRENCE:
01) Facility Condition
I. Operational Occurrence

---

15. DESCRIPTION OF OCCURRENCE:
On December 11, 1993, at 0843 hours (ETZ) a smoke detector in DS Building Air Handler unit servicing rooms 124 and 126 activated. The Mound Fire Department responded and found no smoke present in the air handling unit or room 124 or 126.

A second incident occurred on December 11, 1993, at 2355 hours (ETZ) where the same smoke detector in DS Building Air Handler unit for room 124 and 126 activated again. The Mound Fire Department responded and this time found large amounts of steam in the air handling unit and duct work. No smoke was seen or detected in rooms 124 or 126. The moisture from a steam leak had activated the smoke detector.

This Occurrence Report was reviewed by an Authorized Derivative Classifier (D. A. Homan, Manager, Timers and Components) on 01/20/94 at 1005 hours (ETZ) and contains no Classified or UCNI Information.

---

16. OPERATING CONDITIONS OF FACILITY AT TIME OF OCCURRENCE:
Normal Off-Hours operations existed during occurrence

---

17. ACTIVITY CATEGORY:
Normal Operations

---

18. IMMEDIATE ACTIONS TAKEN AND RESULTS:
After the first incident the Building Manager and Explosive Facility Manager were informed of the incident. The smoke detector was reset and put back into operations.

After the second incident the Fire Department contacted maintenance personnel and the unit was shut down. The steam coil was repaired on 12/13/93.

---

19. DIRECT CAUSE:
1) EQUIPMENT/MATERIAL PROBLEM
A. Defective or Failed Part

20. CONTRIBUTING CAUSE(S):
    1) EQUIPMENT/MATERIAL PROBLEM
       A. Defective or Failed Part

21. ROOT CAUSE:
    4) DESIGN PROBLEM
       B. Inadequate or Defective Design

---

22. DESCRIPTION OF CAUSE:
    The root cause of this occurrence was a design defect in the humidifier system that lacks the ability to sense when the air handling fan is shutdown. A contributing cause was the fan shutdown allowing for heat build up in the ducting. This led to the direct cause which was the failure of the fire damper fusible link that closed the duct and resulted in steam condensation on the smoke detector.

---

23. EVALUATION: (By Facility Manager/Designee)
    Due to an apparent problem with the fire damper fusible link, the humidifier system continued to produce steam which condensed and caused the smoke detector to actuate. The addition of a humidity sensor on the smoke detector side of the fire damper will prevent recurrence if the fire damper closes.

---

24. IS FURTHER EVALUATION REQUIRED?: Yes [ ] No [X]

---

25. CORRECTIVE ACTIONS:
    (* = Date added/revised since final report was signed off)

    01) Modify direct digital control software that will shut down humidifiers in the event the air handling unit fans shut down.

        TARGET COMPLETION DATE: 01/09/1994 COMPLETION DATE: 01/09/1994

    02) Install second humidity sensor in ducting that will shut down humidifier if humidity is high.

        TARGET COMPLETION DATE: 04/01/1994 COMPLETION DATE: Not given

---

26. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH:
    None

---

27. PROGRAMMATIC IMPACT:
    None

---

28. IMPACT UPON CODES AND STANDARDS:
    None

---

29. FINAL EVALUATION AND LESSONS LEARNED:
When steam generating equipment and smoke detectors are located in the same environment, the systems must be designed to prevent excess moisture from coming in contact with the detectors.

07/11/1994 0630 (ETZ) Fred B. Holbrook DOE/MB

12. OTHER NOTIFICATIONS:

13. SUBJECT OR TITLE OF OCCURRENCE:
Actuation of a Safety System

---

14. NATURE OF OCCURRENCE:
01) Facility Condition
I. Operational Occurrence

---

15. DESCRIPTION OF OCCURRENCE:
On July 9, 1994, at approximately 1940 hours (ETZ) a sprinkler head in the Development and Standards (DS) Building west Penthouse actuated. The Mound Fire Department responded to the water flow alarm and did not find a fire or any conditions which might have caused the sprinkler head to actuate. The sprinkler head may have activated due to the last few days of extremely hot weather causing the solder in the head to weaken.

This Occurrence Report was reviewed by an Authorized Derivative Classifier (D. A. Homan, Manager) on 08/08/94 at 1030 hours (ETZ) and contains no Classified or UCNI Information.

---

16. OPERATING CONDITIONS OF FACILITY AT TIME OF OCCURRENCE:
Normal Off-hours operations existed during occurrence

---

17. ACTIVITY CATEGORY:
Normal Operations

---

18. IMMEDIATE ACTIONS TAKEN AND RESULTS:
The sprinkler system was shut down and the head replaced. The system was returned to service after the replacement of the head. Labor crews cleaned up the water in the penthouse and the rooms below where a small amount of water came through the ceiling.

---

19. DIRECT CAUSE:
1) EQUIPMENT/MATERIAL PROBLEM
A. Defective or Failed Part

20. CONTRIBUTING CAUSE(S):
7) EXTERNAL PHENOMENA
A. Weather or Ambient Condition

21. ROOT CAUSE:
1) EQUIPMENT/MATERIAL PROBLEM

21. ROOT CAUSE: (continued)
A. Defective or Failed Part

---

22. DESCRIPTION OF CAUSE:
The direct and root cause of the occurrence was the failure of the sprinkler head solder joint which actuated the fire protection system and the water flow alarms. A contributing cause was the high ambient temperatures over the two weeks prior to this occurrence. These unusually high temperatures (upper 90s) could have weakened the solder joint in the sprinkler head.

---

23. EVALUATION: (By Facility Manager/Designee)
Since the West Penthouse of DS-Building is not air conditioned, the temperatures can reach the low 100s or even higher if the ambient temperatures outside are in the upper 90s. Over an extended period of time (2 weeks) it might be possible to weaken the solder joint in an old sprinkler head (set to actuate at 165 degrees Fahrenheit) sufficiently to allow it to fail when a fire is not present.

If 212 degree Fahrenheit heads were used in areas where high ambient temperatures are possible, instead of the standard 165 degree Fahrenheit sprinkler heads, they would be less likely to actuate after extended periods of high temperatures. The response time in the event of a fire would not be that much slower (a second or two) for the 212 degree Fahrenheit heads according to the Mound Fire Chief.

---

24. IS FURTHER EVALUATION REQUIRED?: Yes [ ] No [X]

---

25. CORRECTIVE ACTIONS:
(* = Date added/revised since final report was signed off)

01) Replace Sprinkler Head

TARGET COMPLETION DATE: 07/09/1994 COMPLETION DATE: 07/09/1994

02) Clean up water.

TARGET COMPLETION DATE: 07/09/1994 COMPLETION DATE: 07/09/1994

03) Replace all sprinkler heads in DS Penthouse with 212 degree Fahrenheit heads.

TARGET COMPLETION DATE: 10/01/1994 COMPLETION DATE: Not given

---

26. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH:
NONE

27. PROGRAMMATIC IMPACT:
NONE

28. IMPACT UPON CODES AND STANDARDS:
NONE

29. FINAL EVALUATION AND LESSONS LEARNED:
When sprinkler heads are repeatedly exposed to ambient temperatures approaching those where the device is designed to actuate, they are subject to failure. In areas where the ambient temperature can reach 120 degrees Fahrenheit. it would be best to use 212 degree Fahrenheit sprinklers versus 165 degree Fahrenheit to avoid weakening the solder during extended periods of high ambient temperatures. The higher degree sprinkler heads add very little to the response time of the sprinkler heads in the event of an actual fire.

14. NATURE OF OCCURRENCE:
01) Facility Condition
E. Vital System/Component Degradation

---

15. DESCRIPTION OF OCCURRENCE:
On April 30, 1994, at approximately 1106 (ETZ) Hours, a common trouble alarm was received from Development and Standards (DS) Building. No personnel were present in the building at the time of the alarm and no evacuation took place. The Fire Department responded to the alarm and found no conditions that would have caused the alarm. The alarm would not reset and an electronic maintenance technician was called to repair the alarm. A lightning storm was present in the area at the time of the alarm.

This Occurrence Report was reviewed by an Authorized Derivative Classifier (D. A. Homan, Manager) on 05/11/94 at 0700 hours (ETZ) and contains no Classified or UCNI Information.

---

16. OPERATING CONDITIONS OF FACILITY AT TIME OF OCCURRENCE:
Normal Off-Hours Operation existed during occurrence.

---

17. ACTIVITY CATEGORY:
Normal Operations

---

18. IMMEDIATE ACTIONS TAKEN AND RESULTS:
The electronic maintenance technician replaced a circuit board in the Data Gathering Panel (DGP), which restored the fire alarms to DS Building.

---

19. DIRECT CAUSE:
1) EQUIPMENT/MATERIAL PROBLEM
A. Defective or Failed Part

20. CONTRIBUTING CAUSE(S):

21. ROOT CAUSE:
7) EXTERNAL PHENOMENA
A. Weather or Ambient Condition

22. DESCRIPTION OF CAUSE:
The direct cause of the common trouble alarm on the fire alarm system for the (DS) Building was the failure of Data Gather Panel (DGP) circuit board due to an apparent over voltage situation. The weather conditions at the time of the occurrence (rain and lightning storms) were contributing to the incident. The root cause of the occurrence was a transient voltage surge to the DS Building DGP which caused the failure of the circuit board. The transient voltage surge was apparently produced by the lightning storm.

23. EVALUATION: (By Facility Manager/Designee)
Mound's fire alarm system is rather old and does not have the surge arrestors available on newer systems. Until funds are made available to upgrade the fire alarm and detection systems these types of incidents will continue to occur.

24. IS FURTHER EVALUATION REQUIRED?: Yes [ ] No [X]

25. CORRECTIVE ACTIONS:
(* = Date added/revised since final report was signed off)

01) Replace circuit board in DS-Building DGP.

TARGET COMPLETION DATE: 04/30/1994 COMPLETION DATE: 04/30/1994

26. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH:
None

27. PROGRAMMATIC IMPACT:
None

28. IMPACT UPON CODES AND STANDARDS:
None

29. FINAL EVALUATION AND LESSONS LEARNED:
Since Mound is being converted to economic development and other facilities are being shut down, it is unlikely that a substantial investment would be made to upgrade the fire alarm and detection systems at this time.

14. SUBJECT OR TITLE OF OCCURRENCE:
Discovery of Legacy Contamination in DS Building (ROLL-UP)

---

15. NATURE OF OCCURRENCE:
01) Facility Condition
D. Loss of Control of Radioactive Material/Spread Contamination

---

16. DESCRIPTION OF OCCURRENCE:
Occurrence #1 -
At 0850 hours (ETZ) on November 5, 1996, Radiological Control Technicians performing a Safe Shutdown radiological survey discovered radiological contamination on a storage cabinet located in DS building, room 221. DS building, room 221, had not previously been posted as a control area. Smears were taken from the cabinet for scintillation analysis. At 1515 hours (ETZ), scintillation results indicated a maximum tritium activity of 2,988,210 dpm/100 cm2. The DOE Radiological Control Manual, Table 2-2, specifies that the maximum allowable amount of removable tritium is 10,000 dpm/100cm2. Since the removable tritium value exceeded twice the allowable DOE RADCON Table 2-2 value, this occurrence was determined to be a DOE 232.1 reportable occurrence.

Between October 28, 1996 and November 6, 1996, other radiologically contaminated items have been discovered in seven other rooms in DS building. Investigations of some of the recently discovered items is still in process. Business entities performing non-DOE related work at the site have had access to some of the rooms where contamination was discovered. Once contamination is discovered in a room, the room is immediately posted as a "Controlled Area". All rooms which still contain contamination or contaminated equipment have been posted as a Controlled Area.

Radiological operations personnel do not plan to post the entire building as a Controlled Area because their analysis of survey results performed to date do not indicate there is a health risk to employees or the public.

This occurrence report was reviewed by an Authorized Derivative classifier (Donald V. Dixon, Space Manager) on 11/7/96 at 1600 hours (ETZ) and contains no classified or UCNI information.

Occurrence #2 - At 0900 (ETZ) on November 12, 1996 Radiological Survey Analysis determined that samples taken

16. DESCRIPTION OF OCCURRENCE: (continued)
from a circuit test board on November 6, 1996 in DS Building room #205 contained 107,238 dpm/100 cm2 of removable tritium contamination.

Occurrence #3 - At 0935 (ETZ) on January 29, 1997 Radiological Survey Analysis determined that samples taken from a metrology equipment storage cabinet on January 27, 1997 in an Uncontrolled Area of DS Building Room #116 contained 23,870 dpm/100 cm2 of removable Tritium contamination.

17. OPERATING CONDITIONS OF FACILITY AT TIME OF OCCURRENCE:
Normal day time operations

18. ACTIVITY CATEGORY:
Shutdown

19. IMMEDIATE ACTIONS TAKEN AND RESULTS:
Occurrence #1 -
DS building, room 221, was posted as a Controlled Area. Other surrounding rooms where the recently discovered contaminated materials and sealed sources reside were also posted as Controlled Areas. A 100% Radiological Survey for DS building is in process.
Occurrence #2 -
DS Building, room #205, was posted as a Radiological Controlled Area. The contaminated Circuit test board was removed and placed in a Radiological Materials Area.
Occurrence #3 -
DS Building, room #116 was posted as a Radiological Controlled Area. The contaminated cabinet drawer was removed and placed in a Radilogical Materials Area.

20. DIRECT CAUSE:
8) Radiological/Hazardous Material Problem
A. Legacy Contamination

21. CONTRIBUTING CAUSE(S):

22. ROOT CAUSE:
8) Radiological/Hazardous Material Problem
A. Legacy Contamination

23. DESCRIPTION OF CAUSE:
The discovery of these "legacy material" contaminations is the result of an intensive free release survey in support of Safe-shutdown. As items are surveyed for release, relatively low level contamination has been found. The actual event that caused these items to become contaminated probably occurred

23. DESCRIPTION OF CAUSE: (continued)
years ago and is being discovered now because of increased monitoring & improved instrumentation sensitivities.

24. EVALUATION: (By Facility Manager/Designee)
There are presently no known uptakes associated with this occurrence.
No effect on the plant, systems, or the environment is expected. The discovery of legacy contamination is expected during monitoring of Safe Shutdown activities.

25. IS FURTHER EVALUATION REQUIRED?: Yes [ ] No [X]

26. CORRECTIVE ACTIONS:
(* = Date added/revised since final report was signed off)

01) Radiological Operations will survey active User Centers and all equipment.

TARGET COMPLETION DATE: 12/01/1996 COMPLETION DATE: 12/01/1996

02) Investigate radiological survey records of Reconfiguration equipment and materials that were transferred to other facilities. If surveys were not conducted, contact the other facilities to notify them of the possibility of contamination of equipment and materials received from DS Building.

TARGET COMPLETION DATE: 03/01/1997 COMPLETION DATE: 03/20/1997

27. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH:
No impact on the environment or worker/public safety and health as a result of this occurrence is expected.

No contamination of individuals on-site, no potential for further spread of contamination, and the affected areas or equipment have been decontaminated, removed, or posted as contamination areas.

The significance relative to applicable limits is as follows:

Occurrence #1 - 2,988,210 dpm/100 cm2 on a cabinet. The allowable limit (from RadCon Manual Table 2-2) for an Uncontrolled Area on-site is 10,000 dpm/100 cm2 for Tritium.

Occurrence #2 - 107,238 dpm/100 cm2 removable tritium contamination. The allowable limit (from RadCon Manual Table 2-2) for an Uncontrolled Area on-site is 10,000 dpm/100 cm2.

27. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH: (continued)

Occurrence #3 - 23,870.4 dpm/100 cm2 on the cabinet drawer. The allowable limit (from RadCon Manual Table 2-2) for an Uncontrolled Area on-site is 10,000 dpm/100 cm2.

28. PROGRAMMATIC IMPACT:
No programmatic impact is expected.

29. IMPACT UPON CODES AND STANDARDS:
None

30. LESSONS LEARNED:
The potential that legacy contamination is present in multiuse buildings is very high and all equipment or materials that are removed from the buildings should, at the very least, be evaluated for radiological contamination. The is especially important if the equipment or materials is being transfered offsite.

The routine statistical radiological survey of all bui would be beneficial in determining which buildings have the potential for contamination.

14. SUBJECT OR TITLE OF OCCURRENCE:
Ethylene Glycol Leak - DS Building

---

15. NATURE OF OCCURRENCE:
02) Environmental
B. Hazardous Substances/Regulated Pollutants/Oil Releases

---

16. DESCRIPTION OF OCCURRENCE:
At 1435 ETZ on 12/08/96 on duty Maintenance personnel determined that an ethylene glycol leak had occurred in DS Building Air Handler #6 cooling coil.
The leak comprised a total of 1880 gallons of 30% solution of Ethylene Glycol. This corresponds to 5,245 pounds of Ethylene Glycol. The CERCLA reportable quantity (per 40 CFR 302) for Ethylene Glycol is 5,000 pounds.

---

17. OPERATING CONDITIONS OF FACILITY AT TIME OF OCCURRENCE:
Normal operating conditions

---

18. ACTIVITY CATEGORY:
Normal Operations

---

19. IMMEDIATE ACTIONS TAKEN AND RESULTS:
Upon discovery of the loss of ethylene glycol pressure, Ethylene Glycol Spill Procedures were initiated. The location of the leak was determined and valved off, and the discharged ethylene glycol contained in the building and the Waste Water Treatment Plant equalization basins with no known release off site.

The failed fitting was replaced and the system returned to operation.

---

20. DIRECT CAUSE:
1) EQUIPMENT/MATERIAL PROBLEM
A. Defective or Failed Part

21. CONTRIBUTING CAUSE(S):

22. ROOT CAUSE:
2) PROCEDURE PROBLEM
A. Defective or Inadequate Procedure

23. DESCRIPTION OF CAUSE:
The Root Cause of the event that permitted the Ethylene Glycol leak to exceed the CERCLA reportable quantity was an inadequate Glycol Spill Procedure. The procedure did not provide the operator with the most logical and explicit instructions that would assist in quickly detecting the location of a Ethylene Glycol leak.

The Direct cause of the Ethylene Glycol leak was determined to be a failed fitting located in the DS Building penthouse attached to Airhandling Unit #6. The fitting appeared to have been subjected to vibration over a long period of time.

24. EVALUATION: (By Facility Manager/Designee)
No effect on the plant or the system is expected. The spilled Ethylene Glycol entered the sanitary sewer system through the floor drains in DS Building penthouse, thus allowing the glycol to be contained at the Waste Water Treatment Plant Equalization basins. The Ethylene Glycol tainted influent was further diluted and pumped to a 65,000 gallon digester in preparation for processing.

25. IS FURTHER EVALUATION REQUIRED?: Yes [ ] No [X]

26. CORRECTIVE ACTIONS:
(* = Date added/revised since final report was signed off)

01) Modify the Ethylene Glycol Spill Procedure in order to; 1) change the order of loop isolation sequence, 2) visually verify that isolation valves have actuated , and 3) Operate secondary pumps to stabilize system,.

TARGET COMPLETION DATE: 01/16/1997 COMPLETION DATE: 01/15/1997

27. IMPACT ON ENVIRONMENT, SAFETY AND HEALTH:
No impact to the onsite/offsite environment, safety, and health of workers or the public is expected. However, The spilled Ethylene Glycol did enter the sanitary sewer system through the floor drains in DS Building penthouse. The glycol was contained at the Waste Water Treatment Plant Equalization basins and the Ethylene Glycol tainted influent was further diluted and pumped to a 65,000 gallon digester in preparation for processing.

28. PROGRAMMATIC IMPACT:
There was no Programmatic Impact.

RESULTS OF RADIOLOGICAL AND VIDEO SURVEYS OF DRAIN LINES AT THE US DOE MOUND FACILITY WITH THE PIPE EXPLORER™ SYSTEM

Prepared for

EG&G Mound Applied Technologies
US DOE Mound Facility

Work Performed Under Purchase Order 14535

January 1997

Science & Engineering Associates, Inc.
6100 Uptown Blvd.
Albuquerque, New Mexico 87110
(505) 884-2300

RESULTS OF RADIOLOGICAL AND VIDEO SURVEYS OF DRAIN LINES AT THE US DOE MOUND FACILITY WITH THE PIPE EXPLORER™ SYSTEM

INTRODUCTION

EG&G Mound Applied Technologies contracted with Science & Engineering Associates, Inc. (SEA) to perform both radiological and video surveys of portions of two buried radiological waste transport drain lines at the US DOE Mound Facility. This report summarizes the results of that characterization effort.

SEA personnel first visited the Mound Facility on November 4, 1996, to attend a kick-off meeting and general orientation of the work site. SEA then calibrated the 2x2-Inch sodium iodide gamma detector for the specific pipe geometries of the lines. The Pipe Explorer equipment was then mobilized, arriving at the Mound Facility on Monday December 2, 1996. The two person SEA field crew arrived at the facility on Monday as well.

New data regarding the radiological conditions in the drain lines required that the SEA personnel complete the Mound Facility, Radiological Worker II training. This training was completed on Monday and Tuesday mornings. The equipment was unpacked on Monday evening and staged at the first access point, manhole STA 2+08. Some minor repairs were made to the equipment on Tuesday afternoon to correct damage suffered during shipment to the Mound Facility. After completing this task, the surveys were initiated. The last survey was completed during the afternoon of Friday December 13. The equipment was then demobilized, and surveyed for potential contamination by an EG&G Radiological Control Technician (RCT). The equipment was packed for shipment on Monday, December 16, and shipped out on Tuesday December 17.

Many of the drain lines surveyed, exhibited properties which made deployment of the Pipe Explorer™ inverting membrane difficult at best. At the outset of this project is was assumed that the drain lines would exhibit little, if any, radiological contamination. Thus, the intent was to survey the entire length of the drain lines to verify that no significant Co-60 contamination was present. The measurements quickly revealed that there was, in fact, substantial amounts of residual Co-60 contamination in each of the drain lines entered. Because of this finding, it was decided not to expend the extra time, both on the part of the EG&G support personnel and the SEA personnel, that would have been necessary to survey the entire length of the drain lines, as the return for the extra effort would have been of marginal value.

DESCRIPTION OF THE DRAIN LINES SURVEYED

The pipe segments surveyed were part of a waste transport system composed of two lines (A-1) and (A-2), which join at Manhole 10. Table 1 provides a listing of the four pipe runs that were surveyed, giving the run ID that is used throughout the remainder of this report, as well as various information particular to the pipe run. The original scope included a fifth run to begin at Manhole 10 and run to the west. The EG&G Project Manager dropped this run from the scope as it became clear that all of the pipes exhibited significant amounts of radiological contamination, and would eventually need to be excavated. Figure 1 shows a sketch of the drain lines that were surveyed. This sketch is not to scale, and is intended only to show the orientation of the lines with respect to each other and identify major features in the area.

Table 1. Description of pipe runs surveyed.

Run ID	Access ID manhole	Deployment direction	Pipe diameter (in.)	Segment length (ft.)	Video survey Length (ft.)	Radiological survey length (ft.)
Run # 1 (A-2)	MH STA 2+08	West->East	8	202	121	71
Run # 2 (A-2)	MH STA 2+08	SE->NW	5	210	29	28
Run # 3 (A-1)	MH STA 2+33	West->East	8	500	259	260
Run # 4 (A-2)	MH STA 2+33	East->West	8	90	83	86

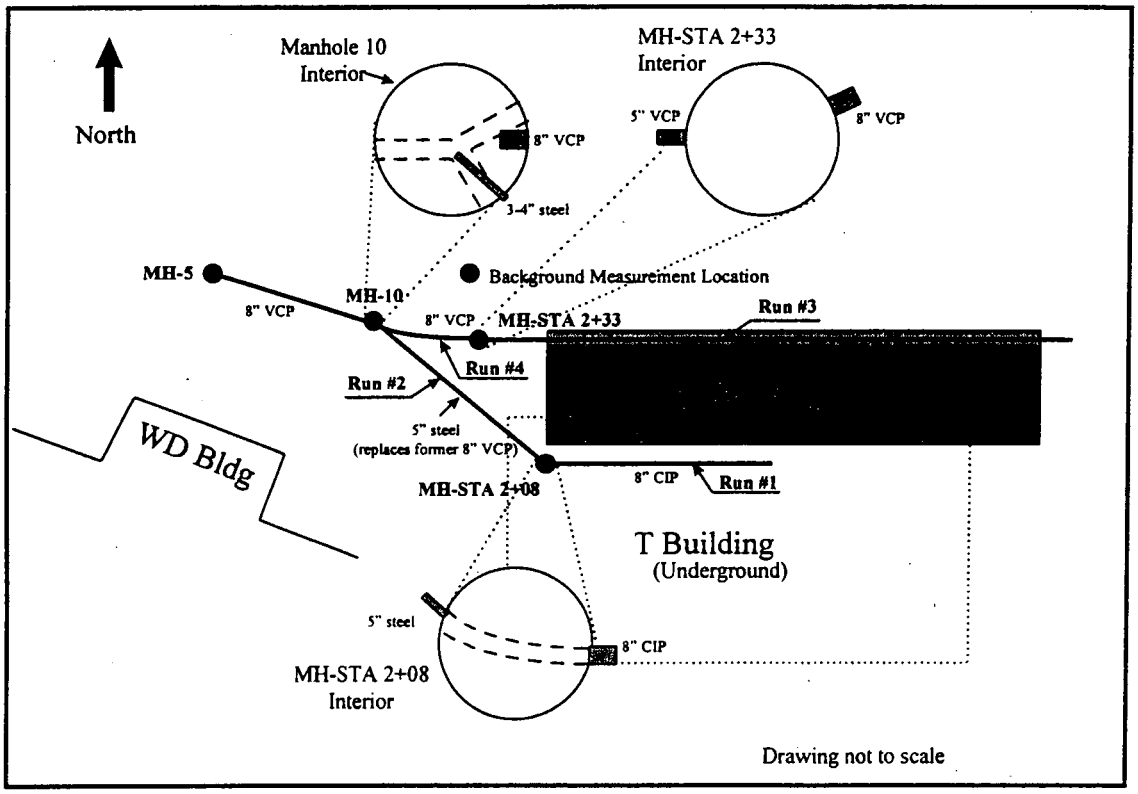

Figure 1. Sketch of the pipe segments surveyed showing the access manholes and Run #'s.

VIDEOTAPING

The videotaping was accomplished by towing a small black & white, CCD video camera equipped with a pin-hole lens. This camera is mounted in a sensor housing that is deployable with the Pipe Explorer™ system. The housing is also equipped with several small incandescent lamps to illuminate the pipe interior. The video signal, with the text identifying the run, date, time and camera distance, was recorded in SVHS format on a high resolution VCR. Two copies of an edited version of this video master are provided in standard VHS format for each of the four pipe runs videotaped. The pipe run ID imprinted on each tape is referenced in Table 1 and Figure 1 for correlation with location of the pipe segments. Due to obstructions and blind ends in some of the pipe runs, SEA was not always able to videotape the entire run length. The actual footage of video surveys performed for each run is shown in Table 1. A short description of the prominent features of each of the videotapes is provided below.

performed during retrieval, which accounts for the depth numbers decreasing from the 0 ft. to -28.8 ft. at the start of the pre-pipe. The end of the membrane is clearly visible, just behind the knot, at the start of the tape. The initial orientation of the pipe bottom is at 1 O'clock. By -3.7 ft. (25.1 ft actual distance) the pipe bottom has changed orientation to the 3 O'clock position. The debris in the bottom of the pipe appears to be a combination of loose pipe scale, gravel, and fine grained sediment. Note the ribbon of extra membrane at the 9 O'clock position. At approximately -12.3 ft indicated (16.5 ft. actual) a ribbon appears at the 6 O'clock position, indicating a decrease in the pipe ID. At -24 ft. indicated (4.8 ft. actual) the pipe bottom changes orientation to the 12 O'clock position. At -28.8 ft indicated the camera starts into the pre-pipe, ending the survey.

Run #3 (A-1)

The videotape for Run #3 (A-1) was initiated at manhole STA 2+33, with deployment occurring in an easterly, upstream direction. This line was constructed from 8-inch vitrified clay pipe. The videotape starts at the end of the pre-pipe. This line is characterized by zones of substantial debris and sediment accumulation interspersed with very clean zones. Initially the pipe bottom is oriented at the 10 O'clock position as the camera is held against the top of the pipe, hanging upside down. A sharp object protruding at the 3 O'clock position resulted in a punctured membrane during the first attempt at video taping this line. At 0.5 ft. the pipe bottom changes orientation to the 5 O'clock position. A pipe joint occurs at 2.5 ft., coinciding with a change in the slope of the drain line. Note that the line is also substantially cleaner. At 4.3 ft. the pipe bottom changes orientation to the 3 O'clock position. Pipe joints visible at the 5.8 and 8.8 ft. positions indicate pipe lengths of 3 ft. were used in construction of the drain line. The pipe bottom changes orientation to the 12 O'clock position at approximately 6.4 ft. The object seen on the inside of the membrane at 10.1 ft. is a piece of grass, picked up when the membrane was stretched out on the grass for measurement prior to its loading into the manual canister. A short section of pipe from 32.7 ft to 34.3 ft. coincides with a change in the slope of the line. At 32.4 ft. the pipe bottom occurs at approximately the 10:30 position as is evident from the dark staining showing the bottom. At 34 ft. the pipe bottom is at the 9 O'clock position and changes to the 6 O'clock position at approximately 34.6 ft. as the camera passes over the change in slope. At approximately 38 ft. accumulation of small amounts of sediment is observable. At 44.5 ft. the pipe bottom is at the 3 O'clock position. Greater thickness of sediment and debris are observable at 55 ft., increasing in depth at approximately 68 ft. A small pile of debris occurs at 110 ft. At 117 ft. the pipe bottom has changed orientation to the 12 O'clock position. Also note a small volume of fluid flowing between the membrane and the pipe wall at this distance. A "T" is observable at the 4 O'clock position at a depth of 120.7 ft. Also note the small volume of fluid flowing in from the "T" and the debris pile directly below the "T" on the pipe bottom. The debris pile and sediment accumulation on the upstream side of this pile extend to a distance of approximately 132 ft. Past this the pipe is relatively clean and free from sediment and debris until approximately 139 ft., where another pile of debris occurs. At this point the pipe bottom is at the 10 O'clock position. Another pile of debris occurs at 152 ft. The debris from 159 ft. to 190 ft. appear to include angular pieces of gravel. A relatively clean section of pipe begins at 198 ft. A "T" is visible at 202 ft. at the 4 O'clock position. At this point the pipe bottom is between the 11 O'clock and 12 O'clock positions. Upstream from this "T" is a debris pile approximately 3 inches deep. There is an apparent build-up of fluid between the pipe wall and the membrane beginning at approximately 213 ft. At this distance the pipe bottom is at the 11 O'clock position. This accumulation of fluid continues to the end of the deployment at 256.8 ft.

Run #4 (A-1)

The videotape for Run #4 was initiated at manhole STA 2+33, with deployment occurring in a westerly to north westerly, downstream direction. This line was constructed from 8-inch vitrified clay pipe. In general this pipe exhibited almost no accumulation of debris and sediment. A 12-inch Lay Flat membrane was used for this pipe, which was slightly undersized, since the pipe exhibited no accumulation of sediment. This resulted in the membrane being decoupled from the pipe wall over a portion of the pipe's interior circumference. Since there were no significant features observed in the pipe it was decided not to repeat the video run with the larger 14-inch Lay Flat membrane. The videotape starts with the

of concluding that there is activity above the background activity when none is actually present and a 5% chance of concluding that there is not activity above the background activity when there actually is. It is important to note that at the MDA a binary decision is being made; Is there activity above background or not? No meaningful quantitative assessment of the activity can be made at this level. As activity levels increase, the certainty in the measure of the amount (or concentration) of activity increases substantially.

The MDA for measurements made inside a pipe geometry, assuming uniform activity distribution, is given by the following formula:

$$MDA = \frac{2.71 + 4.65\sqrt{BKR \cdot t}}{Y \cdot t}$$

Where: MDA = Minimum Detectable Activity Concentration (dpm/100 cm^2)
BKR = Background Count Rate (cps)
Y = Yield Factor [net cps/(dpm/ 100 cm^2)]
t = The count time (s)

An MDA was computed for the measurement conditions incurred for each pipe surveyed. These MDA's are plotted on the data plots in Appendix B and given in the header information of the tabular listings for each survey in Appendix C. The count time used in these computations is the combined count time in those cases where shorter count times were combined into longer intervals.

The measurement results are provided in graphical form in Appendix B. A separate graph is provided for each pipe surveyed with distance from the start of the pipe plotted on the X axis and the computed activity density plotted on the Y axis. The measurement results are also presented in tabular form in Appendix C. The information particular to the run, such as Run ID, information about the pipe, instrument settings used, effective count time, yield factor, background count rate, logging rate, and MDA are all included in the header for the table. The table itself consists of three columns; The sample time, the distance from the pipe datum, and the computed Co-60 activity density in dpm/100 cm^2. The data for Run #3 (A-1) were collected over two days. This break in the data collection appears on page 18 of the data table. Because the data collection occurred over more than one day, a second check source count was performed when the detector was removed from the pipe on 12/13/96. The results of both the beginning and ending check source counts are listed in the table header. Difficulties with the data acquisition during Run #4 (A-1) resulted in the loss of the initial portion of the data for that run. Thus, the initial portion of the run was repeated. This accounts for the break in the sample time seen on page 2 in the tabular data.

DISCUSSION OF RESULTS

In general, the measurement results were other than expected. The initial belief was that these drain lines would exhibit little, if any, residual Co-60 contamination. The data show quite the contrary. Every line surveyed exhibited substantial amounts of residual Co-60 contamination. In general, it appears as though the increased levels of contamination coincide with accumulation of sediment and debris in the lines. The largest activity density measured occurs in Run #3 (A-1) at a distance of 204 ft., which coincides with a debris accumulation and a "T" junction into to the drain line from T-Building.

A special note is warranted regarding the large activity spike seen at a distance of -2.24 ft. in Run #2 (A-2). At this distance the detector was situated within the pre-pipe, approximately at the center of manhole STA 2+08. The pre-pipe was known to be free of contamination, indicating that the signal observed was coming from either surface contamination within the manhole, or contaminated soil associated with the manhole. It should also be noted that because the detector was not in the calibrated geometry, i.e. within the pipe, the activity present is higher that indicated by the data. Note that this feature, although more subdued, occurs in the data from Run #1 (A-2) as well.

Pipe Explorer™ Data Summary Table
US DOE Mound Facility

Run ID:	Run #3 (A-1)
Access Point ID:	Manhole STA 2+33
Pipe Depth Datum:	Start of Pipe In Man Hole
Pipe Diameter:	8-Inch
Pipe Material:	Vitrified Clay

Measurement Parameters:

Radiation Type Measured:	Gamma (Co-60 Energy Window)	
Detector S/N: 1945899 (2x2 NaI)		
Membrane Thickness: 4 Mil		
Effective Count Time: 10 seconds		
Yield Factor:	2.40E-03	(cps/(dpm/100 cm²))
Background Count Rate:	7.56	(cps)
Logging Rate:	1.0	(ft./min.)
MDA	1,800	(dpm/100 cm²)
Checksource (cps)	652	cps
End Chksource (cps)	659	cps
Distance to Pipe Datum:	10.25	(ft.)
Total Deployed Depth:	260.07	(ft.)

Instrument Parameters:

OPERATION TITLE	OPERATION	ISSUE
Chronic Beryllium Disease Prevention Program	D19	1
SUBMITTED BY	ECN	DATE
M. W. Uelen	960302MD	03/04/98

1.0 PURPOSE

This program is for managing beryllium hazards present at Mound as required by DOE N440.1. Provisions within this procedure are designed to prevent unnecessary exposure to personnel and the public.

2.0 SCOPE

This program provides instructions for identifying, evaluating and decontaminating beryllium contamination areas and equipment and controlling occupational exposure. At a minimum, the program will encompass exposure limits, exposure monitoring, engineering and work practice controls, personal protective equipment, training, medical surveillance, record keeping and performance feedback to DOE.

3.0 DEFINITIONS

3.1 ACGIH: American Conference of Governmental Industrial Hygienists

3.2 Aerosols: Liquid droplets or solid particles, dispersed in air, that are of fine enough particle size to remain so dispersed for a period of time.

3.3 AIRBORNE LIMITS: The exposure standards for chemical substances, including beryllium, adopted by DOE-Mound are the ACGIH "Threshold Limit Values (TLVs) for Chemical Substances and Physical Agents in the Work Environment" most current edition.

- The 1996 TLV for beryllium is 2 ug/m^3 and is listed as an industrial substance confirmed of carcinogenic potential for man. In addition, the current OSHA PEL (also adopted by DOE) is.2 ug/m^3 8-hour Time-Weighted-Average (TWA) with a 5 ug/m^3 Ceiling and a 25 ug/m^3 30 minute maximum peak concentration.

3.4 Be-LPT: The Beryllium Lymphocyte Proliferation Test is a blood test that has been adopted to help identify individuals who may be sensitized to beryllium.

3.5 BERYLLIUM: In general, beryllium includes beryllium metal, beryllium oxide, alloys containing ≥ 0.15% beryllium, and beryllium compounds (such as beryllium sulfate).

3.6 BERYLLIUM D&D OPERATIONS: Decontamination and Decommissioning of any past beryllium operation location. Contaminated surfaces may include, but is not limited to rooms, ventilation systems, machinery, and crawlspaces. These areas have the potential for (1) production of aerosols containing beryllium or (2) beryllium contaminated surfaces.

3.7 DYSPNEA: Being short of breath.

3.8 HASP: Health and Safety Plan

3.9 JSHA: Job Safety and Health Analysis

3.9 REGULATED AREA - Refers to a restricted area established to reduce employee exposure. The area is demarcated from the rest of the work place so that it minimizes the number of employees who will be exposed. Warning signs should be posted at entrances and logbooks should be kept to document entrants for medical surveillance purposes.

3.10 SPUTUM: Expectorated saliva

3.11 SURFACE SWIPE LIMIT: The concentration of beryllium observed on a surface that is used as an index of surface cleanliness and does not necessarily indicate a beryllium occupational exposure hazard.

4.0 IDENTIFICATION OF AREAS (HAZARD ASSESSMENT)

4.1 Industrial Safety & Health (IS&H) will conduct beryllium hazard assessments of all known former beryllium operational areas at Mound. In areas where an in-depth analysis is warranted, the Job Hazard Assessment form will be used in conjunction with the Hazard Assessment Procedure MD-80040, Section 1003. Included in the assessments will be analysis of existing conditions, exposure data, sampling requirements, medical surveillance trends and exposure potential of planned activities.

4.2 The Property Management/High Risk Review group requests IS&H approval to excess equipment. Future approval requests may identify machining equipment used in former beryllium areas, not previously known to IS&H. Machining equipment lacking a complete history or proper identification may also arise in requests. Assessment and sampling will be done in both cases.

4.3 Systems/locations that are found to be beryllium contaminated shall be posted with signs provided by Industrial Safety & Health. These signs shall state "Warning- Beryllium Contamination Present- Do not enter/access ventilation system without prior approval from Industrial Safety & Health" or "-Warning- Internal/External Beryllium Contamination" or "Danger- Beryllium Dust (or Fumes)-Inhalation of Dust or Fumes May Cause Serious Chronic Lung Disease- Potential Cancer Hazard-Contact Industrial Safety & Health Prior to Entry."

5.0 HISTORICAL PERSPECTIVE

Beryllium, the lightest structural metal, was employed as a moderator and reflector of neutrons and as a producer of neutrons when bombarded with alpha particles in nuclear operations at Mound. It is a hard, brittle, gray, non-radioactive metal element. The ACGIH has classified beryllium as a "Confirmed Human Carcinogen." The primary hazard with beryllium is the generation of beryllium aerosols and their inhalation. Chronic exposure to beryllium in the past 50 years has led to 88 cases of Chronic Beryllium Disease (CBD) within the DOE complex. CBD is a hypersensitivity reaction that affects a small percentage of the people who inhale beryllium aerosols. As the disease progresses, inflammation and scarring of the lungs make breathing more difficult. The disease is debilitating, life shortening and has no cure.

Past operational areas (declassified), known to the IS&H department, that potentially generated beryllium metal aerosols or machined copper-beryllium metal are listed below:

1. B-building- Rooms# 102 and 105 (beryllium copper alloy work only, contaminated pin cutter in room, no other surface contamination detected).
2. DS-building- Room# 131A contains systems for metal vaporization. Some beryllium may have been vaporized in the belljars before 1970 according to a former area manager. The belljars were changed out in the 1980s and no beryllium/beryllium-copper work has been performed in the area. The system exhaust ports were sampled and found negative for beryllium. The belljars' internal surfaces shall be swiped for beryllium prior to release to the public.
3. E-building- Room# 101 (swipe sampling proved no residual contamination left in room).
4. M-building- Room# 42 (swipe sampling confirmed no residual contamination, no lathes in room at time of sampling). Room# 8 has an excessed Marsburg jig boring machine used in the former T-building beryllium machine shop stored on the main floor. Its surfaces were tested and found positive for beryllium. Warning labels are attached to warn of the beryllium hazard.
5. R-building- Rooms# 118, 119, 120, 121, 123, 133, 137, 145, 149, 152, 160, 161, 164, 167, 169, 177, (Contact Industrial Safety & Health for histories).
6. SW building- Room# 9, Room renovated in 1991, contaminated lathes moved, boxed or excessed. The history is not fully known.
7. T-building, Rooms# 1, 2, 3, 4, 8, 11, 247, 248, 259, 277, 279 (Contact Industrial Safety & Health for histories).
8. Building 46, Room# 1 (beryllium copper alloy work only, internally contaminated lathe in room, no other surface contamination detected).

Where there is a known potential for future exposure occurring from deposition/residue from past operations; Industrial Safety & Health has posted these locations per Section 4.3.

6.0 SURFACE CLEANLINESS/CLEARANCE LIMITS

Industrial Safety & Health evaluates surface cleanliness by collecting the surface swipes and comparing the results to the Mound adopted swipe sample clearance level of .2 ug/100 cm^2 for past beryllium operation areas. Currently, there are no DOE or OSHA adopted or established surface contamination limits.

Surface swipe sampling shall be performed in accordance with MD-80040, Section 1012.

Swipe samples are not quantitative indicators of hazard or personnel exposure. They cannot be correlated with inhalation exposures. They are used to measure surface cleanliness levels and verify the presence of beryllium. The industrial hygienist/industrial hygiene technician must use professional judgement on a case-by-case basis when evaluating the significance of positive swipe sampling results.

7.0 EXPOSURE REDUCTION AND MINIMIZATION

7.1 BERYLLIUM D&D OPERATIONS

Mound has no present beryllium operations. Any Mound activity performed by operating contractor personnel with the potential for beryllium contamination, will occur only during D&D activities.

7.1.1 HASPs, JSHAs and other health and safety related control documents shall make reference to beryllium hazards and the protective measures associated with the Decontamination and Decommissioning of identified facilities.

7.1.2 Special exhaust ventilation systems and air cleaning devices may be needed during beryllium D&D operations to minimize the spread of beryllium aerosols. HEPA exhaust units may be necessary to maintain exposure below airborne limits.

7.1.3 Exposure reduction and minimization principles will be administered by following the Carcinogen Control Program (MD-10286, D3). This program requires regulated areas be established where the anticipated and/or monitored employee exposures to beryllium exceed the action level or if IS&H determines that a significant potential for occupational exposure exists.

7.1.4 Dry-cleaning methods will be prohibited; these methods will resuspend previously settled dust in the workplace air where it can enter the employee's breathing zone. Examples of dry cleaning are shoveling, sweeping, brushing or by the use of compressed air.

7.1.5 Beryllium contaminated equipment shall meet the same swipe sample clearance level of .2 ug/100 cm^2 for excess. There are several options for equipment that tests positive for beryllium contamination.

A. The equipment could be wrapped in plastic, labeled, and sold "as is" with the beryllium contamination and the liability passed on in a purchasing agreement.

B. Comparing the costs associated with decontamination versus the actual cost of the equipment should be done for excess equipment. A dollar value of $10,000 is used by many companies as cutoff for cleaning or disposing of equipment as beryllium contaminated waste.

C. Resampling will be performed on equipment after thorough steam cleaning and flushing with a degreasing agent. If several cleanings cannot reach the .2 ug/100 cm^2, a value less than 1 ug/ft^2 could be accepted as a "best achievable clearance level" depending on the necessity of the equipment.

7.2 EXPOSURE MONITORING

7.2.1. Personnel Exposure: Beryllium D&D operations require workplace and personal monitoring on a frequency established by Industrial Safety & Health per MD-80040, Section 1001. The sampling strategy will require at least one sample for each different job task, during beryllium D&D operations, to allow for representative reporting to all affected employees. Industrial Safety & Health provides workplace sampling results to affected employees in writing.

7.2.2 Ongoing beryllium D&D operations will use an Action Level of 0.5 ug/m^3 to initiate wearing respiratory protection. Industrial Safety & Health will require respiratory protection for any new beryllium related operations that are judged to potentially reach the Action Level.

7.3. PERSONAL PROTECTIVE EQUIPMENT

7.3.1 Respiratory Protective Equipment: Employees must be provided with respiratory protective equipment when engineering or workplace controls may not effectively reduce the exposure to beryllium aerosols below the Action level. General requirements for respiratory protection are given in Mound's Respiratory Protection Manual, MD-10161. Specific respiratory protective equipment requirements for beryllium workers are provided by Industrial Safety & Health and must be included in all HASPs, JSHAs and other health and safety related control documents.

7.3.2 Protective Clothing: Single-use (disposable) coveralls may be used, but must be disposed of as beryllium waste. Protective clothing shall be removed at the end of the employee's shift. In radioactively contaminated work areas, Radiological Engineering and Industrial Safety & Health will collaborate on the required protective clothing needs.

- o Hand Protection: Beryllium workers with open cuts on their hands or those exposed to soluble beryllium compounds (for example, beryllium fluoride) must use latex gloves. When there is a risk for skin cuts, cloth or leather gloves are required.

- o Protective Eye Wear: Personnel must wear safety glasses when the operation could involve beryllium contamination of the eyes.

7.4 WASTE MANAGEMENT

7.4.1. Waste Disposal: Beryllium waste containers containing contaminated clothing, equipment, ventilation systems, and other wastes must be conspicuously marked with the following words: "BERYLLIUM-WARNING, INHALATION OF DUST MAY CAUSE LUNG DAMAGE, SUSPECT CARCINOGEN, MAY PREVENT HEALING OF OPEN WOUNDS." These labels are available from Waste Management. Separate non-radioactive beryllium waste from radioactive beryllium waste where possible.

- o Machining oils used in past beryllium operations may be beryllium contaminated and will require special disposal protocol. Contact the Waste Management Group for information about disposal procedures.

8.0 RESPONSIBILITIES/ACCOUNTABILITY

8.1 Project Managers

- o Responsible for implementing the directives in this program to comply with DOE Order 440.1-7.
- o Ensure that all employees under their direction have received medical surveillance and beryllium training prior to beginning any work with beryllium that has the possibility of reaching the Action level.

8.2 Industrial Safety & Health

- o The Point of Contacts (POCs) working for the project managers shall ensure that beryllium concerns in their respective areas are controlled, following the recommendations of this program, by implementing controls in affected HASPs, JSHAs or other safety documents written, reviewed and/or approved by the POCs.
- o POCs are responsible for informing Medical when new beryllium workers require medical surveillance.
- o POCs perform ongoing inspections of Mound work sites to ensure compliance.
- o Industrial Hygiene personnel shall perform job hazard analyzes (JHAs) for known beryllium work areas.
- o Industrial Hygiene personnel shall perform all monitoring associated with the D&D of beryllium work areas and equipment in accordance with Sections 6.0 and 7.2 of this program.
- o Industrial Hygiene personnel shall recommend specific personal protective equipment for all beryllium work.

- o All records generated by IS&H personnel related to beryllium shall be kept for 75 years.

8.3 Waste Management

Provide guidance with beryllium waste issues and assistance in the disposal of waste.

8.4 Medical

Provide physical examinations to beryllium workers. Maintain all beryllium worker medical records. Responsible for maintaining the log of current and former beryllium workers for the Mound site.

8.5 Central Training

Be in accordance with Section 11.0 of this program.

9.0 GOALS AND PERFORMANCE MEASURES

9.1 GOALS

9.1.1 A. Minimize exposure to beryllium
B. Minimize the number of instances of potential exposure to beryllium
C. Ensure all beryllium workers are properly enrolled in the medical surveillance and properly trained.

9.2 PERFORMANCE MEASURES

9.2.1 A. Perform hazard assessments and sampling as necessary in locations of former beryllium operational areas and equipment.
B. Label and post signs at locations and on equipment/systems that have beryllium contamination. Label and post signs in accordance with section 4.3.
C. Perform an annual program assessment to confirm exposed and potentially exposed workers are identified as beryllium workers and that Medical is complying with the Medical Surveillance portion of this program (section 10.0) and that all personnel with reasonably anticipated exposure to beryllium are trained.

10.0 MEDICAL SURVEILLANCE

10.1 An employee may not begin working in an area posted for its beryllium hazards until Medical has completed a comprehensive pre-placement examination and the employee's manager has received Medical approval to begin work. Regardless of future work assignments, beryllium workers must remain under medical surveillance while they are employed by Mound.

10.2 Accident/Incident Reporting: Beryllium decontamination workers who are injured on the job must report the incident to their supervisor and to Medical in accordance with MD-10286, K1 Accident/Incident Reporting.

10.3 Where historical information links a past operation to beryllium work or if swipe samples exceed recommended levels at the location of a suspect operation, the former workers involved will be identified as beryllium workers.

10.4 Each beryllium decontamination worker should receive an annual evaluation. The evaluation should include:

A. Spirometry, including FVC and FEV1.0

B. A medical history questionnaire that includes presence and degree of respiratory symptoms, (i.e., dyspnea, cough, sputum, production, and wheezing).

C. Physical examination

D. A 14 inch by 17 inch chest X-ray should be offered.

E. The Beryllium Lymphocyte Proliferation Test (Be-LPT) should be offered to all known or self-identified current and former beryllium workers. Workers should understand that the Be-LPT can produce false positive and false negative results.

11.0 TRAINING

11.1 All employees with reasonably anticipated occupational exposure to beryllium shall participate in a training program prior to assignment. Initially, Industrial Safety & Health evaluates operations associated with the admission to beryllium contaminated areas. This evaluation includes the determination for whether beryllium worker training is needed.

11.2 Industrial Safety & Health/Central Training will provide supervisors with job-specific training materials for beryllium decontamination workers; informing them of the hazards of beryllium work, the adverse symptoms of beryllium overexposure, engineering and administrative controls, appropriate emergency procedures, maintenance procedures, housekeeping/ decontamination methods, use of protective equipment, exposure minimization, medical monitoring, and the precautionary measures needed to help ensure a safe work place when working with beryllium.

11.3 All environmental, safety, and health training associated with beryllium work must be documented, whether it is a course or on-the-job training. The present Mound training class for beryllium workers is found under course# 050054 and is titled "Beryllium Health Hazards." There is no annual training requirement at this time.

11.4 In the near future, training requirements may be expanded to match the employee's level of involvement with beryllium. A beryllium awareness training class may be developed to supplement the general beryllium worker "Beryllium Health Hazards" course.

12.0 RECORD MAINTENANCE AND ACCESS

12.1 Exposure monitoring and medical records shall be maintained for at least the duration of employment plus 75 years for all beryllium workers.

12.2 Exposure monitoring and medical records shall be provided upon request to employees and their designated representatives in accordance with 29 CFR 1910.20.

12.3 Industrial Safety and Health will control and maintain all job hazard assessment records, beryllium and beryllium contamination inventories and IS&H sampling data. All air monitoring data are available on the Mound local area network (LAN) through the MESH system.

12.4 Medical shall maintain all records associated with medical surveillance of beryllium workers.

13.0 PERFORMANCE FEEDBACK

13.1 IS&H personnel will perform periodic analysis of monitoring results, the hazards identified, medical surveillance results, attainment of exposure reduction and minimization goals and occurrence reporting data.

13.2 All pertinent findings and results associated with beryllium activities and records' review will be forwarded to project managers, line managers, the medical group and others to ensure that needed information is available to maintain and improve all elements of the Chronic Beryllium Disease Prevention Program continuously.

Job #: H95234C

Dear Mr. Cheng:

HOK/K Industrial, Inc. has completed a Phase I Environmental Site Assessment of the Department of Energy Mound Building DS, located at DOE Mound in Miamisburg, Ohio. Our investigation included an on-site inspection; a review of United States Department of Energy environmental reports and building prints; examination of historical aerial photographs and maps; a review of federal and state regulatory agency records; and personal interviews. A detailed report of the investigation is enclosed.

We understand that DOE Miamisburg Area Office is relying upon the contents of this report to identify Recognized Environmental Conditions that relate to this property. Disclosure of the contents of this report is at your discretion, and HOK/K will not release additional copies without your written authorization. HOK/K Industrial, Inc. performed its investigation according to the ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (Designation E 1527-94). The statements contained in this report are true and accurate to the best of our knowledge.

Sincerely,

HOK/K INDUSTRIAL, INC.

1.0 EXECUTIVE SUMMARY

1.1 At the request of Mr. Sam Cheng of DOE Miamisburg Area Office, HOK/K Industrial, Inc. (HOK/K) has performed a Phase I Environmental Site Assessment of the Department of Energy Mound Building DS located at DOE Mound in Miamisburg, Ohio. This work was performed in accordance with proposal H95-284R1, approved on December 11, 1995. HOK/K performed its investigation according to the ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (Designation E 1527-94).

Our investigation included an on-site inspection; examination of historical aerial photographs and maps; a review of federal and state regulatory agency records; and personal interviews. The property inspections (site visits) for the explosives side of the building (east side) took place on August 7 and 8, 1996, and was conducted by Ms. Jennifer Vicarel. She was accompanied by Mr. Mike Merker of DOE, and by Mr. Ed Bogan of EG&G Mound Applied Technologies Maintenance and Operations Group (M&O). The property inspection (site visit) for the metrology laboratories (west side of the building) took place on October 22, 1996, and was conducted by Ms. Jennifer Vicarel and Ms. Ellen Stanifer. They were accompanied by Mr. Mike Merker of DOE, and by Mr. Don Bornemann of EG&G Mound Applied Technologies Maintenance and Operations Group (M&O). Significant exceptions to, or deletions from, our normal procedures, are described in Sections 2.3 and 2.4 of this report.

- The subject site is located at the Mound Plant, adjacent to the southern perimeter of Miamisburg, Ohio. The entire Mound facility is situated on 305 acres of land and comprises more than 132 buildings.

- The subject property consists of the Mound Building DS footprint and surrounding gravel areas, concrete sidewalks, and grassy hillside. Building DS covers 47,810 square feet of space. The building contains active metrology laboratories and discontinued explosives production operations. A few explosives development laboratories are still operational under CRAIDA (Mound-private sector technology transfer agreements). Several areas within the building have been leased to Star City for the production of flexible circuits. In addition, several laboratories are utilized for Mound shipping and inspection services for incoming Mound shipments.

This assessment has revealed the following evidence of Recognized Environmental Conditions:

- The one potential release site (PRS) related to Building DS and recognized by DOE/EG&G through the FAA/ER combined program is included in our findings as RECs: The DS Building Solvent Storage Shed.

- Twenty-eight other PRSs are located immediately adjacent to Building DS, but are not attributable to operations at Building DS. Most of these PRSs are attributable to operations in Building T, which is located underground at the same location as Building DS. These additional PRSs include underground radioactive waste lines (Main Hill) (PRS 122); T Building solidification unit, T Building solid radioactive waste compactor, and cooling water, condensate and wastewater sumps in the T Building (PRS 213-233); and wastewater, condensate and fire water sumps from Building T (PRS 339-344).

- The interior solvent drain pipes that formerly carried spent solvent from the solvent sinks and discharged to the Building DS solvent storage shed are still in place. In addition, an area of stained and corroded flooring is present beneath the solvent sink.

- Explosive powder may remain in areas in which explosives were stored or utilized on the explosives side of the site building. In addition, several areas in the building, including the area now leased to Star City, the X-ray photographic dark room, and the previous high tech vacuum lab, have or may have chemicals that are no longer used in these specific areas.

- A sink in the X-ray photographic dark room sits on a raised concrete dais with a metal cover, and piping from the photographic development machine appears to be routed into the dais. It is possible that a sump or subgrade vault exists at this location.

Detailed findings and recommendations are included in Section 7.0.

2.0 INTRODUCTION

2.1 Purpose

The purpose of this Phase I Environmental Site Assessment is to identify, when possible, any recognized environmental conditions (defined below) that may affect the subject property.

2.2 Special Terms and Conditions

2.2.1 Environmental Professional - A person having sufficient training and experience necessary to conduct site reconnaissance, interviews and other activities regarding a subject site according to standard practices. The environmental professional develops conclusions pertaining to recognized environmental conditions.

2.2.2 Environmental Site Assessment (ESA) - The process by which a person or entity seeks to determine if a particular parcel of real property (including improvements) is subject to recognized environmental conditions. An environmental site assessment is both different from, and less rigorous than, an environmental audit.

2.2.3 Key Site Manager - The key site manager is the person identified by the owner of a property as having good knowledge of the uses and physical characteristics of the property. Messrs. Ed Bogan and Don Bornemann of EG&G M&O Staff were designated as the key site managers for this project.

2.2.4 Recognized Environmental Condition (REC) - The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicates an existing release, a likely release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

2.2.5 User - For the purposes of this report the user is designated as United States Department of Energy, Miamisburg Area Office.

2.2.6 List of Acronyms - A list of acronyms utilized in this report is presented immediately following the Table of Contents.

2.2.7 Special Conditions

The site area for this Phase I assessment consists of the DOE Mound Building DS footprint and surrounding concrete sidewalks, gravel demolition areas, and grassy hillside. The site does not include the three adjacent T Building entrance shafts.

Unless stated otherwise in the text, all directions in this report are referenced to Mound Plant North, which is 25° 30' 48.53" west of True North. All of the buildings on the Main Hill are aligned with Plant North.

At the request of the client, the Table of Contents for the Building DS Phase I report exactly duplicates the Recommended Table of Contents from the ASTM Standard. Text discussions for certain ASTM sections have been merged to reduce redundancy, and the appropriate sections are referenced.

2.3 Limitations and Exceptions of Assessment

The Building DS site area, as stated above, is completely covered by the building footprint and surrounding concrete pavement or gravel cover. Therefore, soil conditions beneath these areas could not be observed.

Access to the roof of the building was limited, and therefore an inspection of the roof area was not performed.

Finally, several areas in the building were either locked or had limited access. On the metrology (east) side of the building, these included the following areas:

On Room 133 was a private office for the building manager. This office was locked at the time of the inspection.

Room 108 is a mass measurements lab that specializes in high precision standards and testing. This room is kept at a constant 25°C for testing purposes. Due to ongoing precision testing and special clothing requirements, we were requested not to enter this area.

Rooms 129, 130, 130A, 131, 131A, 131B and 132 were locked. These rooms had previously been used for high tech vacuum experiments and had been maintained as clean rooms. The rooms were believed to have been decommissioned and no site contact was available to provide access to these areas.

Room 123 contained obsolete tooling, previously used in the weapons program. The room contains over 5000 items that await disposal. However, trace radiation was

detected on some of the items; consequently this area was quarantined until remediation of the radiation could be completed.

All areas were accessible on the explosives (west) side of the building.

2.4 Methodology Used

2.4.1 On-Site Methodology

Environmental Professionals examined this site. This examination consisted of detailed inspection of the site and a border survey of neighboring properties.

2.4.2 Use of Previous Assessments

2.4.2.1 Building DS is one of more than 132 buildings constructed on the original 182-acre tract of the Department of Energy Mound facility adjacent to Miamisburg, Ohio. Construction at the facility began in 1947. An additional 124-acre tract was acquired in 1981 and is still undeveloped. Numerous and overlapping maintenance programs and environmental programs (including investigation, identification, and remediation of chemical releases) have operated at the Mound Plant over the ensuing half century. Extensive documentation of these programs has created a large library of public information concerning the Mound facility, including Building DS. HOK/K accessed these documents through the Mound Plant's CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act, or Superfund) Public Reading Room, the DOE Miamisburg Area Office CERCLA staff's document room, and from Mr. Mike Merker of DOE. A complete bibliography of the CERCLA Public Reading Room documents is available from DOE, Miamisburg Area Office.

Most of the historical Mound program data collected and reported prior to 1992 was conveniently summarized by EG&G Mound Applied Technologies, M&O contractor, in a twelve-volume Operable Unit 9 (OU 9) Site Scoping Report. To provide the reader with a regulatory framework for the reasons for producing that report, we have included the following excerpt from the Introduction of Volume 12 of the Site Scoping Report:

"The U.S. Department of Energy (DOE) Mound Plant, Miamisburg, Ohio ..., was placed on the ... CERCLA National Priorities List (NPL) on November 21, 1989 (54 Federal Register 48184). The placement of the Mound Plant on the NPL occurred as a consequence of historic disposal practices and releases of contaminants to the environment. The Mound Plant received an overall Hazard Ranking System (HRS) score of 34.61, which exceeded the threshold (28.51) for NPL listing (40 CFR 300, Appendix A). Pursuant to its NPL status, the DOE signed a CERCLA Section 120 Federal Facility Agreement (FFA) with the U.S. Environmental Protection Agency (EPA) that became effective October 11, 1990 (Administrative Docket #VW-'90-C-075). The Ohio EPA (OEPA) became a signatory to the agreement in July 1993. The terms of the FFA require that the DOE develop and implement remedial investigations (RIs) and feasibility studies (FSs) and conduct interim remedial actions in order to ensure that environmental impacts associated with past and present activities at the site are thoroughly investigated and appropriate action is taken to protect the public health, welfare, and the environment.

"The DOE Albuquerque Operations Office (AL) established the Environmental Restoration (ER) Program in 1984 to collect and assess environmental data in order to develop a conceptual site model, to assess both the nature and extent of contamination, and to identify potential exposure pathways and potential human and environmental receptors [at DOE facilities]. In order to provide the EPA with sufficient information and data gathered during these previous investigations, a multivolume scoping report, providing background information, [was] prepared. The [OU 9] Site Scoping Report provides descriptions and summaries of the current conditions and characteristics of Mound Plant and consists of the following volumes:

1. Groundwater Data: February 1987 - July 1990 with Addendum
2. Geologic Log and Well Information Report
2. Addendum - Stratigraphic and Lithologic Logs
3. Radiological Site Survey
4. Engineering Map Series
5. Topographic Map Series
6. Photo History
7. Waste Management
8. Environmental Monitoring Data
8. Addendum - Vegetation and Foodstuff
9. Annotated Bibliography
10. Permits and Enforcement Actions
11. Spills and Response Actions
12. Site Summary Report"

2.4.2.2 Operable Unit 9 (OU9) is a designation of the Mound FFA/Environmental Restoration (ER) program for site-wide studies that provide the framework for compliance with the CERCLA RI/FS process. Investigations that are best conducted for the entire Mound Plant and its regional setting are included in OU9.

2.4.2.3 Final versions of the foregoing twelve volumes date between February 1992 and December 1994. A brief synopsis of these twelve volumes is excerpted from Volume 12, Site Summary Report, and is included herein as Exhibit A. Each volume references its own extensive bibliography.

HOK/K relied primarily on Operable Unit 9 Site Scoping Report: Volume 7 - Waste Management (February 1993), to provide a history of operations at Building DS. This information is discussed in Section 4.3.

HOK/K reviewed Operable Unit 9 Site Scoping Report: Volume 12 - Site Summary Report (September 1994), for a description of all Potential Release Sites (PRSs) at the Mound Plant, including Building DS. PRSs are informally defined potential areas of concern in which knowledge of historic or current use indicates that the site may be considered a solid waste management unit (SWMU, as defined by the Resource Conservation and Recovery Act, RCRA) or has been identified as an area with potential releases of concern. The Site Summary Report not only provides a detailed tabulation of the PRSs at the Mound, but also presents a thorough synopsis of the chronology, authority, and application of the numerous interrelated federal and state regulatory programs in effect at the facility. A discussion of these regulatory records pertaining to the Building DS Phase I assessment is presented in Section 4.0.

2.4.2.4 Building and construction information regarding the whole Mound facility and Building DS in particular was culled from Mound Facility Physical Characterization (December, 1993), prepared by EG&G Mound Applied Technologies. Information from this document is incorporated into Sections 3.2 and 3.3 (Site and Vicinity Characteristics and Descriptions of Structures, Roads, and Other Improvements).

2.4.2.5 Tank information for the entire Mound facility, and Building DS specifically, was collected from the Active Underground Storage Tank Plan, EG&G Mound (November, 1994) by Dames & Moore. These data are presented in both the Records Review, Section 4.0, and in Section 5.5.2, Underground Storage Tanks.

2.4.2.6 Section 5.7.2, Geology, of this report summarizes information from two phases of technical memoranda describing methods and results of the OU9 hydrogeologic investigations conducted by EG&G Mound Applied Technologies:

- OU9, Hydrogeologic Investigation: Bedrock Report (January 1994), and
- OU9, Hydrogeologic Investigation: Buried Valley Aquifer Report (March, 1994).

2.4.2.7 Although asbestos-containing materials (ACM) are not an ASTM-scope issue, at the client's request, HOK/K has included a discussion of ACM. Data compiled from asbestos surveys performed by PEI Associates in 1988 and Barge, Waggoner, Summer, and Cannon Inc. in 1993 were provided to HOK/K by Mr. Timothy Eilers of EG&G Mound Applied Technologies. The ACM data pertaining to Building DS are described in Section 6.1.

2.4.2.8 As described above, the whole Mound facility has been identified as an NPL site under investigation by the EPA and OEPA for radioactive and chemical contamination. Radioactive materials are not an ASTM-scope issue: however, HOK/K has reviewed the Volume 12 - Site Summary Report, which catalogues the potential release sites (including radioactive releases) that have been identified at Mound by DOE/EG&G. Any potential radioactive release sites pertaining to the site area/or detailed in the aforementioned document will be discussed in Section 4.1 of this assessment (Standard Environmental Record Sources, Federal and State).

2.4.3 Historical Information

Title and tax records were reviewed for this assessment to determine previous owners of the property. In addition, the large body of previous assessments, described in the foregoing subsection, provided the historical information as required by the ASTM Standard.

2.4.4 Records Review

Environmental Data Resources, Inc. of Southport, Connecticut, a regulatory database search company, was contracted to provide environmental regulatory information concerning the site and surrounding properties, consistent with the requirements of ASTM Standard E 1527-94. This information was reviewed by an Environmental Professional for indications of recognized environmental conditions.

Because the entire vicinity surrounding the Building DS subject area is a Superfund NPL site, most of the detailed environmental regulatory information for Building DS and adjacent properties (the Mound Plant) was obtained from public documents maintained in the EG&G Mound CERCLA Public Reading Room, as described in Section 2.4.2 above.

3.0 SITE DESCRIPTION

3.1 Location and Legal Description

The Building DS site of the U.S. DOE Mound Plant is located in the central part of the Main Hill of the Mound facility, which itself is situated adjacent to the south side of Miamisburg, Ohio in Sections 30 and 36 (Building DS is in Section 36), Township 2 and Range 5 (from the Between the Miamis survey). Figure 1 shows the general location of the site. Figure 2 shows general site characteristics. Details of the metrology side of the building are presented on Figure 3. Figure 4 depicts details of the explosives side of the building.

3.2 Site and Vicinity Characteristics

Building DS is located at the southern edge of the Mound Main Hill. A mix of concrete sidewalks and gravel areas are located to the north of Building DS. Previously, Buildings 69 and 70 were located here; however both buildings were demolished and removed from the site during this year (refer to Photograph 1 in Exhibit B). Three brick structures (Photograph 2) along the north side of Building DS enclose the entrance shafts to Building T, the 172,963-square-foot tritium development/nuclear operations facility located entirely beneath Building DS, in the side of the Mound Main Hill. The three entrance shafts and Building T are not part of the Building DS site and no physical connection exists between the two buildings.

To the east of Building DS is the site of the former Building 93 (Photograph 3), which was also demolished earlier this year. Building 93 previously housed offices used for the Standards program in support of the defense programs. Beyond the former site of Building 93 to the east and southeast is a steep, grassy slope. Located on the southeast corner of Building DS is a chemical storage shed (Photograph 3). Corridor 425, located on the south side of Building DS, connects it to Building COS, which provides production support for weapons components. With the exception of the chemical storage shed located to the southeast of the building, none of these adjacent buildings are included in the Building DS site area.

The southern edge of the Mound Main Hill slopes steeply down from the narrow grass lawn behind Building DS (Photograph 4 and 5). Steam and chiller brine supply pipes are routed along the edge of the hill (Photograph 6). The hillside is covered with brush vegetation.

A raised concrete dock is located at the west end of Building DS. The dock includes a loading area with a recycling dumpster (Photograph 7), a warehouse, and a tool crib. At the southwest corner of the building, adjacent to the dock, is located a small explosives magazine (Magazine 54) (Photograph 8). The magazine has been emptied of all explosives. The brush-covered hillside and steam and chiller pipes curve around to the west side of Building DS (Photograph 9).

Building DS comprises 47,810 square feet of space which is currently used for metrology and explosives production and development in support of defense programs. The building has been used for these purposes since being constructed approximately 30 years ago.

The overall Mound facility is situated on 305 acres of land and comprises more than 132 buildings having a total of nearly 1.4 million square feet of floor space. The original 182-acre site, purchased by the Manhattan Engineering District in 1946, is formed by two topographically high areas (hills) and a lower intermediate valley area. Building DS is located on the northern, or Main Hill, of these two high areas. The more recently-acquired 124-acre tract (1981) is generally undulating toward the southwest and is not currently developed.

The Mound Plant is bordered on the west by a Conrail Railroad line and the north-south trending Miami-Erie Canal. The northwest quadrant of the property slopes steeply (approximately 170 feet of relief) down to the Great Miami River flood plain. The northern boundary of the plant abuts an historic residential neighborhood of Miamisburg, Ohio. Mound Road marks the northern half of the eastern perimeter of the facility, then veers east away from the southern half of the eastern boundary. A golf course, the Miamisburg Mound State Memorial park, old agricultural fields, woodlots, and scattered residential properties border the Mound facility on the east. Benner Road forms the southern property line of the Mound Plant, with agricultural fields and farms occupying the lands beyond.

In the immediate vicinity of Building DS, the following adjacent buildings of the Mound facility are located:

Building	Square Footage	Current Use	Direction From BLDG. DS
70	3,366	Quality (Removed 1996)	North
69	1,620	Production/Tritium Surveillance (Removed 1996)	North
COS	64,654	Development/Production	South
93	2,936	Standards (Removed 1996)	East
T	Nuclear Operations Tritium Develop. Laboratories Health Physics	172,963	Below
N/A	N/A	Sloping Grassy Area	West
N/A	N/A	Sloping Grassy Area	South, Southeast
N/A	N/A	Sloping Grassy Area	West, Southwest

3.3 Descriptions of Structures, Roads, and Other Improvements on the Site

Building DS is a one story, concrete block with brick facade, constructed slab-on-grade with built-up roof. The interior walls are finished primarily with painted plaster, or ceramic face tile wainscoting with painted plaster above. The ceilings are constructed of both painted plaster and dropped ceiling tiles. Flooring materials include primarily vinyl or asphalt floor tiles. Some of the floors in the laboratory and storage areas are of finished cement. There is raised flooring in the very eastern side of the building, along both the north and south corridors and adjoining rooms (see Figure 2).

The current building includes an expansion from the original footprint, an eastern addition constructed in approximately 1967. This expansion appears to have doubled the size of the original building. A penthouse was constructed on the roof of the addition to house mechanical equipment.

While operations in most of the areas of metrology and some areas of the explosive side of the building are on-going, one area which was previously a high tech vacuum testing area, is no longer operational. Many of the production areas in the "explosive" side of the building are no longer operational. Currently, these areas are undergoing safe shutdown; including cleaning the areas and divesting the areas of equipment.

A depiction of the major features of Building DS and the placement of major installed appliances and instruments is provided in Figures 3 and 4. Types of equipment installed in Building DS include laboratory testing equipment, fume hoods equipped with solvent disposal sinks, and solvent storage cabinets.

Metrology department provides calibration services for "clients", which include other Mound operations. They use international standards to calibrate and certify the accuracy and traceability of instruments throughout the facility. The Metrology department is in full operation and no part of that specific operation is scheduled for shut down.

The Metrology department consists of a series of laboratories, each designed to measure specific physical parameters. Room 103 is a dimension lab (Photograph 10). The instruments in this laboratory will measure any type of dimension, including length, width, circumference, threading, and contours. Other equipment includes a coordinate measuring machine, a torque testing machine, and a non-contact optical measuring machine. Cabinets found in the laboratory contain standards used for calibration purposes.

Room 107 is a second dimensions testing lab (Photograph 11). These rooms, including rooms 107, 107A, and 107B, are temperature and humidity controlled. Instruments in this area include additional dimension measurement machines.

Room 110, including 110A and 110B, comprise the electrical testing laboratory (Photograph 12). This laboratory can measure such parameters as RF factor, voltage calibrations, etc. A separate room, located in the back of the laboratory, was constructed to service an electrical load of 100,000 kV for specific testing purposes (Photograph 13). However, according to Mr. Bornemann, the safety team was uncomfortable with specific safety factors; consequently the room was never completed or put into service. Equipment in the room includes temperature controlled baths for measurement of standard resistance (Photograph 14).

Rooms 134, 135, 135A and 135B make up the Pressure measurement laboratory. One instrument located in this laboratory can measure hydraulic pressures up to 200,000 psi (Photograph 15). Other instruments are used to calibrate pressure standards, gages and volumes. A large instrument equipped with a water bath is used for volume calibration (Photograph 16). Liquid nitrogen found in the area is

used in cryogenic pumps, which are used in the calibration of accelerometers for the heat source program. There is also a force/tension measurement machine with the capability to measure up to 10,000 foot pounds.

Rooms 109, 109A, 109B and 109C make up the mass measurement laboratory. Here, scales and balances are calibrated and refurbished (Photograph 17). Room 108 is a mass measurement laboratory used for high precision testing. This room is maintained at a constant 25°C for testing purposes.

Room 106 is a general storage room. This room contains a forklift, a chemical storage cabinet, large 300- to 500-pound weights (Photograph 18) and the drinking water and sprinkler mains. Room 114 is a janitor closet which contains industrial cleaning supplies and a floor sink (Photograph 19).

Rooms 119 and 125 are used by the receiving and inspection department (Photograph 20).. Here new equipment is analyzed to confirm that the equipment will meet the manufacturers specifications before becoming incorporated in on-site laboratory and production use. This equipment includes optical comparitors and a coordinate machine. Room 125A contains several temperature chambers (ovens) and some additional dormant equipment. Room 125B contains four fume hoods, two with sinks (Photograph 21). One of the sinks was a solvent disposal sink with a collection tank below the counter. The tank has been removed.

Rooms 120, 121, 122, 124, 126, 126A and 126B are currently leased to Star City. Star City uses these areas for the production of flexible circuitry. Room 120 contains two large presses and a large laminator (Photograph 22). Room 122 includes a hand assembly and inspection and testing area. Equipment in this room includes a fume hood, a bridge head cleaner, and two laminar flow fume hoods (Photograph 23). Rooms 126 and 126B contain a resist laminator (Photograph 24, two large exposing units using UV light to expose images onto the photo resist (Photograph 25), a large optical alignment punch, and a small laser. Etching and development of the circuits is completed in one of three etching machines located in Room 124 (Photograph 26). These machines have a wastewater discharge directly to the sanitary sewer and a direct air emission. According to Mr. Bob Tomasoski, the air discharges are permitted.

Room 118 is utilized by the Metrology department to store computer software. In addition, a flammable cabinet holds chemicals wastes generated by the Metrology laboratories that await disposal. The room also includes two fume hoods, one with a sink (Photograph 27).

Room 123 contains obsolete tooling. Currently this room contains over 5000 items, most of which were part of the previous weapons program. The items were tested prior to disposal and trace radiation was detected on a number of the items.

Therefore, entrance into this area was not permitted.

Room 127 contains the temperature laboratory (Photograph 28). Equipment in this laboratory includes three temperature baths of different chemical mediums (including propylene glycol, 210H Fluid, and Fluornert FC-77) used as a temperature control. Room 127C contains a temperature and humidity calibration system and Room 127B is an office.

Room 127A is separate from the temperature laboratory and includes a sand blaster and dust collector and bulk chemical storage for the Star City circuitry operations (Photograph 29).

Rooms 129, 130, 130A, 131, 131A, 131B and 132 were not accessible as part of the on-site inspection. These areas were indicated as "clean rooms". Spill kits (for substances representative of some of the chemicals used) were located in the central corridor to these rooms (Photograph 30). According to Mr. Bornemann, these rooms were previously testing laboratories for high tech vacuum applications, but are no longer in operation. Through glass windows, equipment and chemicals were observed remaining in many of the rooms (Photograph 31); however, it was not possible to obtain specific information on these.

Outside the southeast corner of Building DS is a metal chemical storage shed (Photograph 3). This shed had a raised floor. At the time of the inspection, the shed was empty (Photograph 32). Additional information is presented regarding the metal shed in Section 4.3.

Several of the rooms on the Metrology side of the building are utilized as office space. These offices include Rooms 111, 112, 113, 115, 108A. In addition, many of the laboratories will have small, private offices or cubicles for technicians of the specific laboratory.

Room 133 is the Metrology Control Center (Photograph 33). This room contains all files and records from the Metrology department. Protocol dictates that each instrument calibration record be maintained in this area until the instrument leaves the Mound, at which time the calibration records are archived for 5 years, then moved to a general storage area. There is also a smaller, private office within this room, which is occupied by the building manager.

The Explosives side of the buildings (western side) was used for weapons production. Most of the operations on this side have ended, and many of the rooms are undergoing safe shutdown procedures, including cleaning of rooms and removal of equipment. Ongoing operations are under the direction of either CRAIDA (for the design laboratories) or CA (for the production laboratories). CA, which stands for cooperative agreement, and CRAIDA are transfer-of-technology programs between the DOE and private industry.

As part of the safe shutdown operation, many of the rooms have been cleaned and are non-operational but still may contain equipment. These rooms include 202, 207, 209, 209A, 212, 212A, 214, 217, 220, 222, 223, 224, 225, 225A, 229, 229A/B/D, 234, 251, 251A/B, and 257. Some of the types of equipment in these rooms would include microscopes, desiccators, ovens, fume hood, presses, explosive barricades, computers, and installed laboratory workstations (counters or work tables, wall cabinets, drawers, shelving).

The Room 208/213 complex was the former X-ray laboratory. Room 213 includes 3 X-ray units which were also labeled as containing helium neon lasers (for alignment purposes) (Photograph 34). Room 208 contains map cabinets and locked files, but is predominantly empty. Room 208B is a dark room formerly used for X-ray developing. A developing machine with two tanks is found here (Photograph 35). The silver recovery unit is found in line with the piping. The room also holds a refrigerator filled with film and empty chemical storage cabinets. Room 208C had an X-ray machine removed and now stands empty.

Room 251A is called the "tray room" (Photograph 36). It contains a large cafeteria style sink and a bath cleaner used for cleaning explosive shipping and packing trays. Room 233 is an oven room for tray drying (Photograph 37). It contains five large industrial-sized ovens. Some shipping materials are currently stored in this area.

Some of the rooms in the "explosives" section of the building remain operational. Room 201 is currently being used to grind part numbers and drawing numbers off of the equipment as part of Safe Shutdown operations (Photograph 38). Rooms 203, 204, 205B, and 248 are used as office space. Room 213A contains office space and some surplus equipment. Room 243 contains offices, a break area and a storage area with a flammable storage cabinet containing small amounts of chemicals including cleaners and degreasers. Rooms 249/250 contains the shipping department. Supplies in this area include packs of recycled parts, crates of parts with the design drawing number removed (Photograph 39).

Some of the operational areas on the explosives side are used by private groups under a CRAIDA or CA (Mound technology transfer efforts). Rooms 221, 221A, 221B, 221C, 221D, 221E and 221F were used for explosives and weapons development. Several of the rooms (221A, 221B, and 221C) have high bay ceilings.

In addition, rooms 221A, 221B, 221C, 221D and 221E were constructed with a blowout wall along the rear. At the time of the inspection, all explosive materials were reported to have been removed from this bank of rooms. Room 221 was empty with the exception of some supplies and a microscope on a work table. Room 221A is equipped with a refrigeration unit and an air booster equipped with an air compressor. Chemicals found in this room include two empty cans of ethyl alcohol, and one empty hazardous waste can. Room 221B was dedicated to enclosed explosives. Contents of this room are limited, and include a microscope, a Mound-made solid copper table for development purposes, and empty wall shelving. Room 221C contains a large press, a welder, a lathe, a microscope, and a hemispherical instrument labeled explosive. Room 221D contains a Dorst press used for bulk explosive pellet production (Photograph 40). This press had a slight oil leak (Photograph 41). There were also two additional presses which had drip pans with absorbent material and oil staining (Photograph 42). The room also contains two desiccators and two balances. In Room 221E explosives were encapsulated. Much equipment remains in this room, and a CRAIDA operation continues to work in this area (Photograph 43 and 44). Room 221 F was clean and empty, with the exception of a work table and contour gauge.

Room 218 contains a large laboratory used under a CRAIDA agreement; the operation is preparing to move from this area in the near future. The room contains a large environmental chamber, with heating and freezing capabilities (Photograph 45). An explosive chamber, used for destructive testing, is also here (Photograph 46). In addition, the room has work tables (Photograph 47) and tool boxes.

Room 227 was used for development, and is currently used under a CRAIDA agreement. The room contains two large computerized explosives barricades (similar to explosive chambers) with meter instruments. Room 227A was also used for development. This room now contains computer terminals and other office type equipment. In addition, a press, possibly for punching holes in metal, was in this room. Room 227B was again used for development. This room contains bulk explosives, bottles of mineral oil, and pyrotechnic equipment which is static sensitive (Photograph 48). The room is equipped with a non-static grounded floor. In addition, the room holds a pyrotechnic oven and several desiccators and balances.

Room 241 is used for detonation diagnostics. The room contained instruments, computers and two lasers (Photograph 49). In addition, four cylinders of mixed nitrogen and neon gas were stored here.

Room 215 and 206 are used for laser welding. Laser welding is used to encapsulate the explosives. Equipment in Room 215 includes microscopes, wire welders, etc. (Photograph 50). Chemicals include squirt bottles of acetone and alcohol (Photograph 51). Room 206 is also a laser welding room used to provide a hermetical seal on an explosive-filled part (Photographs 52 and 53).

Room 231 is a laser welding development lab used for finding laser ignited detonators (Photograph 54). Bulk explosives are used in this area. The room contains spectroscopy type equipment including the laser welders (Photograph 55).

Room 245 is the ion separator laboratory, containing a 30-foot long Varian ion separator (Photograph 56), three robotic units, and a smaller ion separator (Photograph 57).

Room 254 is a janitors closet. This room contains a floor sink with a floor drain (Photograph 58).

The West Dock Warehouse contains wooden crates of steel plates, metal parts and dies, and two empty pyrotechnic waste materials cans (Photographs 59 and 60). The west dock platform houses some chemical storage, including four large cylinders of nitrogen (Photograph 61), two cylinders of helium, three cylinders of argon and four to five empty cylinders (Photograph 62). Several jugs of vacuum pump oil were noted in a tool cage located on the west dock adjacent to the warehouse (Photograph 63). In addition, a drum labeled "Hazardous Waste Used Vacuum Pump Oil" was staged here (Photograph 64).

Most of the buildings at Mound, including Building DS, are heated by steam. There are two steam boilers located in the Powerhouse (Building P). The boilers generate saturated steam at 125 psig, which is distributed through above-ground pipes on elevated stanchions to the various buildings and the pressure is reduced to 30 psig for use in the buildings. The condensate is collected in the buildings in vented condensate receivers and is returned to the powerhouse for feed water to the boilers.

Many of Mound's buildings, including Building DS, are air conditioned by central chiller systems that chill and circulate an aqueous solution of 30 percent, by volume, ethylene glycol to the buildings through pipes elevated on above-ground stanchions. There are two central chiller systems: One is in the Powerhouse and one is in Building 95.

At Building DS, the above-ground steam and chiller pipes on stanchions are routed past the east end of the building and enter on the south side of the building (Photograph 65).

Potable water and sanitary services at Building DS are provided by the facility. The Mound Plant operates a potable water treatment plant (Building 24) that provides drinking water for the facility using groundwater produced from three on-site production wells (with a fourth well planned FY 1995-1996). The Mound facility also operates an on-site sanitary sewer treatment plant (Building 57) to manage the plant's sanitary wastewater pursuant to a National Pollutant Discharge Elimination System (NPDES) permit issued by OEPA.

3.4 Information Reported by User Regarding Environmental Liens or Specialized Knowledge or Experience

Mr. Mike Merker of DOE Miamisburg Area office was interviewed regarding site environmental liens. Mr. Merker indicated that there were no environmental liens or deed restrictions encumbering the property. Mr. Ed Bogan and Mr. Don Bornemann of EG&G Mound Applied Technologies was interviewed during the site visit regarding the site history, current activities and waste disposal practices. Their knowledge, and that of Mr. Merker, of recognized environmental conditions related to the current or previous use of this property is referenced and documented in the appropriate sections of this report.

3.5 Current Uses of the Property

See Section 3.2.

3.6 Past Uses of the Property

See Section 3.2 and Section 4.3.

3.7 Current and Past Uses of Adjoining Properties

See Section 3.2 and Section 4.3.

3.8 Site Rendering, Map, or Site Plan

See Figures 2, 3, and 4.

4.0 RECORDS REVIEW

4.1 Standard Environmental Record Sources, Federal and State

Environmental Data Resources, Inc. provided information regarding sites in the vicinity of the subject site which appear in regulatory agency summaries and databases. Sites under the jurisdiction of the following regulatory offices or programs were included in the EDR search report (provided in Exhibit C):

- Contaminated sites on the National Priorities List (NPL) which have been designated by the United States Environmental Protection Agency (EPA) as eligible for Superfund cleanup assistance;
- Sites which have been investigated or are scheduled for investigation, under authority of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA);
- Sites under investigation by the Ohio Environmental Protection Agency (OEPA) for possible hazardous waste are included in the OEPA Master Sites List. In the EDR report this list is referred to as State Hazardous Waste Sites (SHWS) records;
- Hazardous waste generator notifiers (LQG, SQG, and CEG) regulated under the Resource Conservation and Recovery Act (RCRA);
- RCRA hazardous waste treatment, storage, and disposal facilities (TSD);
- State licensed landfills;
- Leaking underground storage tanks (LUST) recorded with the Ohio Division of State Fire Marshal's Bureau of Underground Storage Tank Regulation (BUSTR);
- Underground storage tanks (UST) registered with BUSTR;
- Generators, transporters, commercial storers and/or brokers and disposers of polychlorinated biphenyls (PCBs) registered with EPA and recorded in the PCB Activity Database (PADS);
- Facilities that release toxic chemicals to the air, water, and land in reportable quantities under the Superfund Amendments and Reauthorization Act (SARA) Title III, Section 313, and which are identified in the Toxic Chemical Release Inventory System (TRIS);

- the United States Environmental Protection Agency Emergency Response Notification System's (ERNS) database of accidental releases of oil and hazardous substances.

- and "FINDS", a listing by the EPA of any site that has been reported to the agency as part of any regulatory requirement (e.g., permitting, hazardous waste generation) and does not necessarily indicate an environmental release.

There are fifteen sites within the appropriate radii (ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Sites Assessment Process Designation E1527-94), designated below as well as in the EDR Report which appears in Exhibit C.

PROPERTY NAME	ADDRESS AND PROXIMITY	STATUS
U.S. DOE Mound Plant	Mound Road Miamisburg, OH (target property)	NPL, PADS, CERCLIS, LUST, TRIS
D.J. Ceramics	611 S. Main St. Miamisburg, OH (W NW)	LUST
CG&R	901 S. Main St. Miamisburg, OH (W)	LUST
GMC Delco Products Div.	329 E. First St. Dayton (Miamisburg), OH (N NW)	RCRIS-SQG, FINDS
Dayton Public Schools	348 W. First St. Dayton (Miamisburg), OH (N NW)	RCRIS-SQG, FINDS
City of Miamisburg Pump Station	1021 S. Main St. Miamisburg, OH (W SW)	UST
Richard Church, Sr. Estate	1009 S. Main St. Miamisburg, OH	LUST

PROPERTY NAME	ADDRESS AND PROXIMITY	STATUS
Presto Adhesive Paper Co., Inc.	222 Mound Ave. Miamisburg, OH (N)	RCRIS-LQG, FINDS
Jack's Mobile	51 Center Street Germantown, OH (NNW)	LUST
Technicote, Inc.	222 Mound Ave. Miamisburg, OH (N)	RCRIS-SQG, UST, LUST
Plocher Andrew Sons	418 E. First St. Dayton (Miamisburg), OH (N NW)	RCRIS-SQG, FINDS
Shell Oil Co.	1224 S. Main St. Dayton (Miamisburg), OH (SW)	UST
Point Store	155 S. Main St. Miamisburg, OH (N)	LUST
Miamisburg Water Treatment Plant	302 S. Riverview Miamisburg, OH (NW)	LUST
Miamisburg Well Field/ Unknown Source	302 S. Riverview Ave. Miamisburg, OH (NW)	SHWS (organics contamination of groundwater)

4.1.1 Except for the Mound Plant itself, on which rests the subject property, all of the remaining identified sites listed above are located north or west of the site. These directions place these other sites as much as 170 feet lower in elevation than the Mound Main Hill, thus they are down gradient (or downslope in terms of surface water, and probably groundwater, flow). In this position these other sites are very unlikely to adversely effect the soil or groundwater conditions at the subject site.

4.1.2 The Mound site, however, has been identified as a contaminated site on the National Priority List under CERCLA (Superfund) since 1989, as described above in the Previous Assessments section (2.4.2). The Mound site was

originally listed as a consequence of historic disposal practices including use of a commercial/industrial landfill, various spills, and the use of underground storage tanks, resulting in the contamination of soils and drinking water. The original contaminants of concern were calcium cyanide, copper cyanide, plutonium and its compounds, specifically plutonium-238, and uranium and its compounds. Following its listing as an NPL site, DOE signed a CERCLA Section 120 Federal Facilities Agreement (FFA) with EPA, effective October 11, 1990. OEPA entered into the agreement in July 1993. The FAA, and its implementation through the DOE Environmental Restoration Program, requires DOE to perform RI/FSs and conduct interim remedial actions to ameliorate the environmental impact associated with past and present activities in order to protect the public health, welfare, and the environment.

As a result of the investigations and documentation conducted to comply with the CERCLA cleanup process via the FFA/DOE ER program, DOE and its M&O contractor (EG&G Mound Applied Technologies) tabulated all the potential release sites identified under the various regulatory programs in effect at the site. Many additional contaminants of concern and types of operations were identified beyond the original NPL listing of site activities. A total of 345 PRSs have been identified and are described in the OU9 Site Scoping Report: Volume 12 - Site Summary Report, Appendix A. This table has been reproduced in Exhibit C of this report. Of these 345 PRSs, one was attributed to operations at Building DS (refer to Figure 2 for locations):

- PRS 128 - DS Building Solvent Storage Shed: This storage shed is located at the southeast corner of Building DS (Photograph 3). During the on-site inspection, this building was empty; however, the Site Summary Report has the storage shed listed as in service. According to the report, chemicals stored in the shed included organic solvents (including 1,1,1-trichloroethane, trichlorofluoromethane, ethanol, and trichloroethane). The Site Summary Report also recorded a suspected release from this storage area. The area is managed by the Mound Plant operations and maintenance program.

Twenty-eight other PRSs are located immediately adjacent to Building DS, but are not attributable to operations at Building DS. Most of these PRSs are attributable to operations in Building T, which is located underground at the same location as Building DS. These additional PRSs are described below:

- PRS 122 - Underground Radioactive Waste Lines (Main Hill): These lines are shown running underneath both the north and south sides of Building DS on the Site Summary Report location map. The waste lines appear to

originate further to the west of Building DS and are not related to any activities in Building DS. The Site Summary Report lists these waste lines as inactive. According to the report, the lines carried alpha wastes from the SW building, R building and H building and waste water from B Building. The alpha wastes included plutonium-238 and cobalt-60. A release is suspected from these lines; however no further data was available.

- PRS 213-233 - These potential release sites include areas from Building T, including T Building solidification unit, T Building solid radioactive waste compactor, and cooling water, condensate and wastewater sumps in the T Building. With some exception, all sites remain in service. The PRS 213, T Building solidification unit, status is historical and contained cobalt-60 and polonium-210. In addition, PRS 225, a Room T-23 Beta Wastewater Sump, is listed as historical and as having contained beta wastewaters. PRS 226-PRS 233, all wastewater sumps, are all listed as historical and filled with concrete. These PRS contained nonradiological wastewater and alpha wastewater. There are no known releases from PRS 213-233 and no other data is available.

- PRS 339-344 - These PRS include wastewater, condensate and fire water sumps from Building T. PRS 339-340 are wastewater sumps from Tanks 250 and 251, respectively, and are listed has historical and filled with concrete. These sumps accepted wastewater and there is no suspected release. PRS 341 is a condensate sump, listed in service with no suspected releases. PRS 342-344 are fire water sumps that accept wastewater/radioactive wastewater. All three sumps are listed as in service and there was no suspected release from these sumps.

Many of the T Building tanks and sump PRS are also catalogued in the Active Underground Storage Tank Plan (referenced in Section 2.4.2.5). Refer to Exhibit D, the PRS table, for tank numbers and to Exhibit E for the corresponding tank information.

4.1.3 In compliance with permit requirements under RCRA, the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA), and the Clean Air Act (CAA), the Mound has applied for or has received permits for its surface water discharges, air emissions, and hazardous waste program. The Mound has submitted both a RCRA Part A and Part B Permit application and operates as a RCRA hazardous waste treatment and storage facility under interim status. Mound also maintains a NPDES surface water discharge permit with facility I.D. Number OH009857. Permits for the open burning of wastes involving explosives and other fuels have been issued by the Regional Air Pollution Control Agency (RAPCA). Other operations that produce particulate or vaporous emissions are registered with RAPCA and

OEPA. The Mound also submits annual Emergency and Hazardous Chemical Inventory Forms to the OEPA, pursuant to SARA Title III, the Emergency Planning and Community Right-to-Know Act. The 1995 version of this report indicated that nitric acid, argon, sulfuric acid and nitrogen are stored at Building DS in quantities above regulatory thresholds.

4.1.4 DOE has legal authority derived from the Atomic Energy Act of 1954 (AEA) to conduct routine operations at Mound involving, among other things, underground tanks, equipment and other facilities. "Routine operations" include both the operation of currently active sites and the Decontamination & Decommissioning (D&D) of surplus sites. DOE has authority under the AEA to respond to any environmental contamination known or discovered for both active and inactive tanks. Because DOE has signed an FFA, it also has authority and responsibility derived from CERCLA and the FFA. The authorities of the AEA and CERCLA overlap, but CERCLA explicitly recognizes the integration of the overlapping authorities. At Mound, a D&D/ER Program agreement was established April 26, 1991, to define the soil activity responsibilities between the two programs.

4.2 Physical Setting Source(s)

See Figure 1 and Section 5.8.

4.3 Historical Use Information

A history of the site was developed to identify past uses that may have an environmental impact. HOK/K performed a review of title records at the Montgomery County Recorder's Office in Dayton, Ohio, to obtain a history of ownership. HOK/K also relied on previously published Mound documents, principally the OU 9 Site Scoping Report: Volume 7 - Waste Management (February 1993), to provide this history of ownership and operations.

A history of ownership for Building DS must obviously reflect the ownership history of the Mound Plant. Title records indicate that the government of the United States of America acquired the three parcels representing the original 182-acre tract from individual owners between April and September, 1947. The United States government purchased the four lots representing the 124-acre tract between July and August, 1981. These properties had been owned by one individual and one investment company.

History of ownership and operation for the Mound facility is further detailed in the following information excerpted from Volume 7 - Waste Management:

"In the summer of 1942, the United States Army organized the Manhattan Engineer District for the purpose of developing an atomic bomb. This undertaking became known as the Manhattan Project. In 1943, the Director of Monsanto Chemical Company's (MCC's, now Monsanto Corporation's) Central Research Department in Dayton, Ohio accepted responsibility for the chemistry and metallurgy of radioactive polonium-210, and the Dayton Project was launched." MCC operated five units of the Dayton Project at various locations around the Dayton area. For Dayton Unit V (more formally the Dayton Engineer Works under the Dayton Engineer District), a 182-acre site on the outskirts of the town of Miamisburg in Montgomery County, Ohio, was selected in 1946 as the location of the permanent research facility in support of the Manhattan Project. "In July of 1946, Monsanto Research Corporation (MRC), a subsidiary of MCC, engaged the firm of Giffels and Vallet of Detroit, Michigan, to design the plant ... Construction of the new facility, consisting of 14 original buildings, began in February 1947 by Maxon Construction Co., Dayton, Ohio. The plant was the first permanent facility of the [Atomic Energy Commission] AEC, which had succeeded the wartime Manhattan Engineer District. The Mound Laboratory was occupied by MRC personnel in May 1948, and operations involving radionuclides began in January 1949.

"Mound is a government-owned and contractor-operated facility, originally administered under the Oak Ridge Operations Office of the AEC. The plant was assigned new production and development functions in 1955 when the administrative control was assumed by the AEC's Santa Fe operations office. The Santa Fe Operations Office was changed to the Albuquerque Operations Office in April 1956. In January 1975, the plant formally came under the Energy Research and Development Administration (ERDA) upon dissolution of the AEC. In October 1977, the plant was incorporated into the DOE complex and the facility designation changed from Mound Laboratory to Mound Plant. MRC was the sole operating contractor until October 1988, when EG&G-Mound Applied Technologies took over."

As described previously, Building DS was constructed in 1966 for the purpose of explosives production and development and metrology in support of defense programs. The metrology department has always occupied the eastern half of the building, and explosives development and production has occupied the western half of Building DS.

The Volume 7 - Waste Management document describes the Mound's detonator and explosives programs in some detail, concentrating on chemical usage and waste generation. This section (Section 2.16) is excerpted from Volume 7 - Waste

Management and included as Exhibit F in this report. Two processes described therein, in particular, apply to Building DS operations.

The first of these two explosives processes is pyrotechnic and tape development (see Section 2.16.1.4. in Exhibit F). This work is conducted in Rooms 124 and 126 of Building DS. The process, now described as flexible circuit production, has changed little from the process for tape production described in Volume 7 - Waste Management. The operation of this process, however, has now been assumed by Star City, a private enterprise that has spun off from EG&G and which has assumed several other former Mound defense program operations.

The other DS process described in Volume 7 - Waste Management is explosive processing (see Section 2.16.1.6 in Exhibit F). The description provided applies to operations in several Mound buildings other than Building DS. Most of the explosives processing work in Building DS took place in the development laboratories.

Overall explosives waste generation information is also described in Section 2.16.2 of the Volume 7 - Waste Management document (see Exhibit F).

Additional chemical waste management information in Volume 7 - Waste Management describes the Building DS solvent storage shed (see Exhibit F). The shed is still present at the southeast corner of Building DS. The solvent transfer pipelines (described in the excerpt in Exhibit F) are also still in place and originate at a solvent disposal sink in Room 125B, are suspended along the southern wall of Building DS (Photograph 66), and extend to the solvent storage shed at the southeast corner of the site building. According to Mr. Bornemann, the solvent transfer lines have been drained of solvent. This information was corroborated when Mr. Borneman opened one of the pipelines during our site visit and found it to be empty. The solvent storage shed is also now empty.

4.4 Additional Record Sources

4.4.1 Interviews

Interviews with Mr. Ed Bogan and Mr. Don Borneman produced the following information regarding past practices and operations at Building DS:

Solvent Transfer Pipelines from Room 125. Mr. Bornemann indicated that the solvent disposal sink in this room was formerly equipped with a solvent collection tank underneath the sink. The tank has been removed. Solvent delivery lines and solvent waste transfer lines are piped into this room.

Room 123. Mr. Bornemann described the contents of this locked room (reported in Section 3.3) which was not accessible during our site visit. He also stated that one radiation had been detected on one part; thus the room has been quarantined until a Mound Health Physics radiation survey has been completed.

High Tech Vacuum Area. Mr. Bornemann had no knowledge of the actual operations performed in this area, but was able to state that these rooms (described in more detail in Section 3.3) have always operated as clean rooms since their constructions.

Explosives Area. Mr. Bogan indicated that bulk explosives had been utilized in the following rooms while explosives production or development was in operation: 221C/D, 218, 225A, 227B, 235, and 231.

Encapsulated or contained explosives were or are being used in the following rooms: 205, 207, 209, 214, 222, 217, 223, 220, 221, 221A/B/E/F, 225, 224, 226, 227, 234, 206, 215, 249, 250, and 251A.

4.4.2 Aerial Photographs

Aerial photographs from 1938, 1949, 1962, 1968, 1975, 1980, 1987, and 1995 were reviewed and copies are found in Exhibit G.

The 1938 photograph shows the Mound acreage as agricultural fields and undeveloped wood lots. The historic Miamisburg Indian Mound is visible for location reference.

The 1949 aerial shows the completed initial phase of construction on the Mound Main Hill. Approximately fourteen buildings are visible; however Building DS has not yet been constructed. The towers associated with Building T (located underground, beneath Building DS) are visible in this aerial photograph. Roadways on both the Main Hill and the eastern hill are present.

The 1962 and 1968 photographs show expanding activities at the Mound. While Building DS is not visible in the 1962 aerial photograph, both the original building footprint and the western addition are visible in the 1968 aerial photograph.

The overall Mound facility, as depicted in the 1975, 1980, 1987, and 1995 photographs, shows continuing change and expansion. Since this report focuses on Building DS, we will not include a detailed description of these changes on the Mound, but will concentrate our discussion in the next

sentences on Building DS alone. The aerial photographs for 1975, 1980, 1987 and 1995 show Building DS much as it appears in the 1968 aerial photograph and much as it is today.

4.4.3 Historic Sanborn Fire Insurance Maps

Sanborn Map coverage was not available for the Mound facility. A copy of the Sanborn Map Request Response is included in Exhibit H.

4.4.4 Building Prints

A series of building prints were made available to HOK/K by Mr. Tom Bruggeman of EG&G Mound Applied Technologies. The prints for the DS building include the addition constructed in approximately 1968. Detailed information regarding the original building and the addition was not available from the building prints.

5.0 INFORMATION FROM SITE RECONNAISSANCE AND INTERVIEWS

5.1 Interior Observations

5.1.1 Heating/Cooling

The heating and cooling system for Mound was described in Section 3.3. Where present throughout rooms in Building DS, steam, boiler water and condensate pipes were marked. Most of the HVAC equipment is located in the penthouse on the roof; however, this penthouse was not accessed during the inspection.

As mentioned in Section 3.3, the HVAC steam pipes and chiller water pipes are suspended along the eastern side of Building DS, then wrap around the southeast corner and enter the building through the southern side of Building DS (Photographs 65 and 66).

5.1.2 Stains or Corrosion

In the rear of Room 125 is a cleaning hood with solvent dispensers and a sump for previous cleaning operations. Under the cleaning hood are stains that appear to be from past chemical storage practices (Photograph 67).

Stains were also observed in several of the rooms currently occupied by Star City. Chemical containers left by EG&G left staining under a work table in room 122 (Photograph 68). In addition, staining was observed in a chemical storage area in Room 126A (Photograph 69).

5.1.3 Drains and Sumps

Floor drains were noted in some of the explosive laboratories and assembly areas. To the best of Mr. Bogan's knowledge, these are all routed to the sanitary sewer system at the present time.

Each of the janitor's closets (Rooms 114 and 254 contain a floor sink (i.e. service sink) with a floor drain.

Room 219 has a manhole (person way) with a metal manhole cover (Photograph 70). This may be a sanitary sump pump, according to Mr. Bogan.

One disconnected solvent drain sink is located in Room 125. This sink is fitted into a fume hood, and drains or formerly drained into an approximately 5-gallon stainless steel tank installed in the cabinet beneath

the sink. The tank was formerly equipped with a pump and connected to above-ground solvent pipes that carried spent solvent to the Building DS solvent storage shed. The solvent sink collection tank has been removed from Room 125 (Photograph 67). Mr. Bornemann believed that the associated piping had been emptied by EG&G Safe Shutdown staff. This was confirmed when Mr. Bornemann opened the valves to the piping; no solvent was discharged. The solvent storage shed is empty; however, the above-ground solvent piping, suspended from Room 125 along the outside southeastern wall of the site building, remains in place.

A sink located in the X-ray photographic dark room (Room 208B) is installed in a cabinet sitting on a raised dais with a metal cover, giving the appearance of a subgrade vault (Photograph 71). Mr. Bogan had no knowledge regarding the construction, contents, or condition of this feature. The distribution of the photographic development rinsewater piping in this room was also not clear, but could possibly be routed into the raised dais area. See Section 7.0, Findings and Conclusions.

5.2 Exterior Observations

5.2.1 Pits, Ponds, or Lagoons

No ponds or lagoons were noted on or adjacent to the site.

5.2.2 Stained Soil or Pavement, Stressed Vegetation

No stained soil or pavement or stressed vegetation was evident on the exterior of Building DS during the site visit.

5.2.3 Wells

There was no evidence of wells (such as a road box or pipe stick-up) at Building DS. In addition, our key site manager Mr. Bogan had no knowledge of any wells around Building DS.

5.2.4 Odors

No unusual odors were noted within Building DS.

5.2.5 Hazardous Waste

At the present time, very little hazardous waste is generated in the course of operations in Building DS. The Metrology laboratories use very small quantities of lubricating oils and solvents and alcohols in the routine

maintenance of the machines and cleaning of the machines, standards and samples. As a matter of routine operation, the solvents and alcohols are placed on a rag, used for cleaning purposes, then disposed via the sanitary waste. The small quantities of wastes generated by the Metrology laboratories is staged in a flammable storage cabinet in Room 118 (Photograph 72), where the EG&G Waste Management group will coordinate the proper disposal of these chemicals.

The flexible circuitry operations performed by Star City in Rooms 120-126 does generate hazardous wastes, particularly in the etching and developing operations. Some of these wastes, spent ferric chloride and ElectroBrite, are being collected and stored in drums. To date, the hazardous waste has not been generated in quantities that require disposal. According to the Star City contact, Mr. Bob Tomasaski, Star City will be responsible for the proper disposal of these wastes. Other wastes, principally sodium carbonate, are discharged with the rinsewaters to the sanitary drain. Mr. Tomasaski stated that Mound Industrial Hygiene staff had determined that these rinsewaters were not hazardous.

The hazardous waste generated in the Explosives side of the building is similar to the waste from the remainder of the building. It includes very small quantities of spent solvents and cleaners. In addition, a now disused X-ray photographic developer, found in the explosives area, generated hazardous wastes which were passed through a silver recovery unit and then were reportedly discharged to the sanitary sewer system, according to Mr. Bogan. Our key site manager also believed that Mound Waste Management had removed any accumulated silver from the recovery unit.

5.2.6 Waste Water

Industrial process waste water discharges are described above in Section 5.2.5.

Engineered storm water flow is directed in a southwestern direction away from Building DS. Stormwater is collected in two locations on the north side of the building. These drains appear to run underneath the building and discharge on the southwest side of the building. Additional storm water is collected on the southeast corner of the building and directed in a southeast direction. Additional sheet flow runs downhill on the south, east and west sides of the building. All storm water is ultimately discharged into the main drainage ditch along the base of the Main Hill (Per Volume 4).

Sanitary wastewater is directed in drainlines that run along the north and south sides of Building DS. These lines converge with several other lines

to the west of the building. From that point, sanitary flow is directed southwestwardly to the wastewater treatment plant.

In Section 4.1.2. underground radioactive waste lines (Main Hill) (PRS 122) is described as running underneath both the north and south sides of Building DS on the Site Summary Report location map. The waste lines appear to originate further to the west of Building DS and are not related to any activities in Building DS. The Site Summary Report lists these waste lines as inactive. According to the report, the lines carried alpha wastes from the SW building, R building and H building and waste water from B Building. The alpha wastes included plutonium-238 and cobalt-60. A release is suspected from these lines; however no further data was available.

5.2.7 Septic Systems

There was no evidence of septic systems (such as leaching field or septic tank vent pipes) in the vicinity of Building DS. According to Mound documentation, there are no septic systems on the Mound Plant because it is serviced by a sanitary sewage treatment plant.

5.3 Hazardous Substances in Connection with Identified Uses

There are some hazardous substances stored within or around Building DS. The chemicals are associated with laboratory operations, production operations in the flexible circuitry production area, and in the janitorial closets.

Most of the laboratories contained small flammable storage cabinets used to keep small quantities of chemicals needed for laboratory operations (Photographs 73, 74, 75). These chemicals include solvents, alcohol, oils and lubricants, and mercury. Some of these chemicals were located in small squirt bottles (or other similar amounts) for use at various testing machines or laboratory stations (Photograph 76).

Hazardous substances are used in the production of flexible circuitry by Star City. Chemicals include alcohol, acetone, electrobright, sodium carbonate, ferric chloride and nickel sulfamate. Bulk quantities (55-gallon drums and 5-gallon containers) are stored in Room 126A (Photograph 69). Additional quantities (stored in 55-gallon drums and smaller drums) of these chemicals are stored in Room 127A (Photograph 29), and gallon-size containers are stored in the cabinet beneath the fume hood in Room 124 (Photograph 77). There were also some chemicals stored in the fume hood in the Star City flexible circuitry production area (Room 122) that are not used as part of the process (Photograph 78). According to Mr. Tomasoski, these chemicals were left by EG&G operations.

Hazardous substances from the explosives side of the building include the same type of solvents and cleaners as outlined above. In addition, an x-ray photographic developer is located on this side of the building (Room 208B) and may still contain hazardous photochemicals in the two photochemical tanks. Mr. Bogan believed that they had been emptied by Mound Waste Management staff.

5.4 Hazardous Substance Containers and Unidentified Substance Containers

There were no unidentified substance containers noticed during the Building DS site walkovers. There were containers of materials inside Rooms 129-132 (previously the vacuum laboratory). Because access to these rooms was not obtained, no comment can be made on the contents or labeling of these containers.

Refer to 5.3 for discussion of hazardous substance containers.

5.5 Storage Tanks

5.5.1 Above-Ground Storage Tanks

No above-ground storage tanks were observed on the Building DS site during the site inspection. However, several gas storage cylinders remain in a cylinder storage area on the exterior of the east side of the building and on the west dock.

5.5.2 Underground Storage Tanks (USTs)

No evidence of USTs (such as vent or fill pipes) was observed inside or outside of Building DS. The key site manager had no knowledge of any USTs ever having existed at Building DS. There are, however, a number of underground storage tanks associated with Building T. These USTs, listed in the Active Underground Storage Tank Plan (referenced in Section 2.4.2.5, are also included in the PRSs as described in Section 4.1.3. A copy of the tank listing from the Active Underground Storage Tank Plan is included in Exhibit E.

The USTs associated with Building T consists of various sumps used for cooling water, sanitary waste, fire water, and alpha wastewater. Some of the tanks have been made inactive and may be included in the D&D program. Other sumps remain active. Refer to Exhibit E.

5.6 Indications of Polychlorinated Biphenyls (PCB's)

Under the Toxic Substances Control Act (TSCA), the EPA regulates the manufacture, distribution and use of PCBs. PCBs are a known carcinogen and are persistent in the environment. They were formerly widely used in the dielectric fluid of electrical transformers and capacitors, and in the oil of hydraulic systems. PCBs are also present in the ballasts of fluorescent lamps.

At Building DS, no fluid-filled type transformers were observed. One dry-type transformers was observed in Room 215. This type of transformer does not typically contain PCBs.

Fluorescent lighting is used throughout Building DS. Fluorescent lamp ballasts contain a small capacitor that may contain high concentrations of PCBs (greater than 900,000 ppm). All lamp ballasts showing a manufacture date through 1979 should be regarded as containing PCBs. If a ballast is not labeled "No PCBs," it should be considered to contain PCBs regardless of the date of manufacture.

Used lamp ballasts that are leaking PCB material are fully regulated under CERCLA and TSCA and must be incinerated at a TSCA approved incinerator. Used, non-leaking PCB-containing lamp ballasts are eligible for disposal as municipal solid waste, although EPA encourages proper disposal of PCB materials in a chemical waste landfill or a high temperature incinerator, which completely destroys the PCB material. However, incineration is costly and landfill disposal carries the potential for future cleanup liability. Lamp ballasts can be successfully recycled, and facilities disposing of waste fluorescent lamp ballasts should consider this disposal alternative.

5.7 Indications of Solid Waste Disposal

Solid waste was not observed in the site building, other than trash cans in the office and laboratory areas. A solid waste recycling dumpster of standard industrial size was noted at the west end of the building. It was indicated that this recycling dumpster was owned and serviced by Laidlaw.

5.8 Physical Setting Analysis

5.8.1 Surface Topography

A map of the area is included in Figure 1. This map is based on the U.S.G.S. 1965 (photo revised 1974) 7.5 Minute Topographic Map of the Miamisburg, Ohio Quadrangle. The facility elevation ranges between 720 and 900 feet msl. Based on an evaluation of the surface topography, surface water flows in all directions away from the Mound Main Hill. In

the vicinity of Building DS, surface water is assumed to flow down the steep grade to the south of the building, and from there southwest toward the Great Miami River.

5.8.2 Geology

An extensive site-wide (OU 9) hydrogeologic investigation has been completed by EG&G for the Mound Plant. The five technical memoranda written as part of the hydrogeologic investigation were cited in Section 2.5.2. Only a brief summary of geologic highlights for the Mound vicinity are described below.

The bedrock at the Mound Plant is comprised of marine shales and limestones of the Ordovician System within the Cincinnatian Series.

The nature and distribution of natural fractures studied during the referenced investigation indicate that a fracture carapace (zone at the surface) is superimposed on the bedrock beneath Mound Plant. This fracture carapace is believed to consist of a network of interconnected vertical and bedding plane fractures that are water-saturated in the lower parts and unsaturated in the upper parts.

The aquifer system at the Mound Plant consists of two different hydrogeologic environments: groundwater flow through the bedrock beneath the hills and groundwater flow within the unconsolidated glacial deposits and alluvium associated with the Buried Valley Aquifer in the Great Miami River valley. The bedrock flow system is dominated by fracture flow; the Buried Valley Aquifer is dominated by porous flow with interbedded gravel deposits providing the major pathway for water movement. The Buried Valley Aquifer occupies the southwestern quadrant of the Mound site.

Based on the available data, the fracture carapace and underlying, relatively unfractured bedrock have different hydraulic characteristics. The fracture carapace has permeability values ranging from 0.09 to 0.9 ft/dy and the underlying bedrock has permeabilities that range from 1.3×10^{-3} to 2.9×10^{-2} ft/dy. The permeability of the fracture carapace and bedrock that underlie the Mound Plant is at least three orders of magnitude less than the Buried Valley Aquifer, which has an average permeability of 500 to 1,500 ft/dy. Because of this quality, the Buried Valley Aquifer has been designated a sole source aquifer consistent with the Safe Drinking Water Act.

The Mound Plant maintains three drinking water production wells completed in the Buried Valley Aquifer, along the western edge of the facility. Miamisburg Water District production wells are located approximately one-half mile northwest of the Mound facility on the other side of the Great Miami River.

5.9 Other Conditions of Concern

See Section 7.0, Summary of Findings.

5.10 Site Plan

See Figures 2, 3, and 4.

6.0 NON-SCOPE CONCERNS

Certain areas are considered beyond the ASTM standard scope of the Phase I Environmental Site Assessment. These areas are provided for informational purposes below.

6.1 Suspected Asbestos-Containing Material

ACM in buildings can be found in three forms: sprayed or troweled on ceilings and walls (surfacing materials); insulation around pipes, ducts, boilers, and tanks (pipe and boiler insulation); other products such as ceiling and floor tiles and wall boards (miscellaneous materials). ACM is of greatest concern when it is friable. Friable material can be crumbled, pulverized, or reduced to powder by hand pressure.

Asbestos surveys were performed for EG&G by PEI Associates in 1988 and Barge, Waggoner, Sumner, and Cannon Inc. in 1993. ACM was detected in Building DS, and in many places the ACM is so marked within the building. Exhibit I presents summary tables of the ACM detected during the Building DS asbestos surveys.

6.2 Lead Paint

Lead based paint was used almost exclusively in the U.S. prior to the 1970's. Congress established maximum lead concentrations in residential paint in 1978. Due to the age of the building (constructed in approximately 1966) it is possible that lead based paint has been used within the buildings. The risk of a lead based paint hazard exists when the painted surfaces are damaged (cracked, chipped, loosened, chewed). Several areas of chipped and peeling paint were observed, particularly in the southern corridor on the east side of the building and Rooms 219 and 220 on the explosives side of the building (Photograph 70). Analysis of the paint would be necessary to determine if there is lead paint and if a lead hazard exists.

6.3 Radon

The results of radon testing of 35 buildings in the same zip code as this site (45342) are on file with the Regional Air Pollution Control Agency in Dayton, Ohio, and were provided in the EDR report in Exhibit B. The average reading for the basement area of tested buildings was 5.963 picocuries/liter as compared to the EPA recommended standard of 4.0 picocuries/liter.

Radon levels are very site specific, depending heavily on location and the building ages and construction. Radon does not normally pose a threat in commercial or industrial buildings for several reasons. The fresh air which enters the structure and the venting provided can reduce the buildup of radon gas. In addition, human exposure in these facilities is usually limited to eight hours per day. The EPA's recommended standard of 4.0 picocuries/liter is based on the assumption of sixteen hours exposure per day.

A simple screening test can be performed to determine actual on-site radon levels.

6.4 Electromagnetic Fields

There are no high-power electrical transmission lines or transformer substations within the immediate vicinity of the subject property. Electromagnetic radiation originates from the electromagnetic fields (EMFs) which surround electrical conductors, such as electrical transmission lines. Epidemiologic studies have linked an increased risk of childhood leukemia for children living in homes which are near high-power transmission lines. Research in this area is ongoing, and, at present, there are no regulations or guidelines for exposure to electromagnetic radiation. One study found that fields of less than 2 milligauss may be acceptable. This research has been conducted for children exposed at there residences. The estimated electrical field is expected to drop to 2 milligauss at approximately 200 feet from the power line. Development plans for this site should consider the possible effects of EMF.

6.5 Fluorescent Lamps

Fluorescent lamps are used for lighting throughout this facility. Fluorescent lamps contain on average between 35 and 75 milligrams of elemental mercury and trace amounts of other hazardous heavy metals (e.g., cadmium and lead). Mercury is highly toxic to humans and animals, causing both immediate and long-term effects.

According to current federal law, used fluorescent lamps are considered a solid waste. Used fluorescent lamps are not listed as a hazardous waste under Code of Federal Regulations, Volume 40, Part 262.11 (40 CFR 262.11), but under RCRA, used fluorescent lamps are subject to evaluation against the RCRA hazardous waste characteristics, including the toxicity characteristic. The Toxicity Characteristic Leaching Procedure (TCLP) is a test to determine if a waste is characteristically hazardous. The regulatory limit for mercury is 0.2 milligram/liter. If TCLP results from fluorescent lamp samples show that mercury concentrations equal or exceed this limit, the waste must be managed as a hazardous waste. Conversely, if TCLP results are below the 0.2 mg/L mercury limit, the waste is not considered hazardous and can be managed as municipal solid waste.

In Ohio, used fluorescent lamps must be initially characterized to determine if they are hazardous via the TCLP test. If used fluorescent lamps are characteristically hazardous and bound for disposal, lamps must be managed in compliance with all of Ohio's applicable hazardous waste requirements. If, however, the characteristically hazardous used lamps are bound for recycling or reclamation, they are not considered a solid waste and are not subject to Ohio's hazardous waste requirements. Facilities using and disposing of fluorescent lamps should evaluate their disposal program and should consider recycling or reclamation as an alternative to other disposal methods.

7.0 FINDINGS AND CONCLUSIONS

7.1 HOK/K Industrial, Inc. has performed a Phase I Environmental Site Assessment of the DOE Mound, Building DS located at DOE Mound in Miamisburg, Ohio. Any exceptions to, or deletions from, our standard procedures are described in Section 2.3 of this report.

This assessment has revealed the following evidence of Recognized Environmental Conditions:

- One of the potential release sites (PRS) recognized by DOE/EG&G through the FAA/ER combined program is included in our findings as RECs:

  The DS Building Solvent Storage Shed is included here because the Site Summary Report includes information that a release of organic solvents previously stored in the shed is suspected. Further study, including possible physical testing of the surrounding soils for contamination, would be necessary to determine any environmental impact from the storage shed. The area is managed by the Mound Plant operations and maintenance program.

- Twenty-eight other PRSs are located immediately adjacent to Building DS, but are not attributable to operations at Building DS. Most of these PRSs are attributable to operations in Building T, which is located underground at the same location as Building DS. These additional PRSs are described below:

  Underground Radioactive Waste Lines (Main Hill) (PRS 122) are shown running underneath both the north and south sides of Building DS on the Site Summary Report location map. The waste lines appear to originate further to the west of Building DS and are not related to any activities in Building DS. The Site Summary Report lists these waste lines as inactive. According to the report, the lines carried alpha wastes from the SW building, R building and H building and waste water from B Building. The alpha wastes included plutonium-238 and cobalt-60. A release is suspected from these lines; however no further data was available.

  Potential release sites (PRS 213-233) include areas from Building T, including T Building solidification unit, T Building solid radioactive waste compactor, and cooling water, condensate and wastewater sumps in the T Building. With some exception, all sites remain in service. PRS 213, the T Building solidification unit, status is historical and contained cobalt-60 and polonium-210. In addition, PRS 225, a Room T-23 Beta Wastewater Sump, is listed as historical and having contained Beta wastewater. PRS

226-PRS 233, all wastewater sumps, are all listed as historical and filled with concrete. These PRS contained nonradiological wastewater and alpha wastewater. There are no known releases from PRS 213-233 and no other data is available.

These PRS (PRS 339-344) include wastewater, condensate and fire water sumps from Building T. PRS 339-340 are wastewater sumps from Tanks 250 and 251, respectively, and are listed has historical and filled with concrete. These sumps accepted wastewater and there is no suspected release. PRS 341 is a condensate sump, listed in service with no suspected releases. PRS 342-344 are fire water sumps that accept wastewater/radioactive wastewater. All three sumps are listed as in service and there was no suspected release from these sumps.

While the above mentioned PRS are not directly attributable to Building DS, they should be considered in any future development plan for Building DS. The majority of PRS listed would contain radioactive waste or wastewater and many are suspected of having had a release. A more detailed investigation would be required to accurately determine the environmental impact of these immediately adjacent PRS on Building DS.

- The interior solvent drain pipes that formerly carried spent solvent from the solvent sinks and discharged to the Building DS solvent storage shed are still in place. The entire plumbing network and location of the lines should be determined, and if necessary the pipes should be drained and removed. In addition, the area of stained floor tile under the solvent sink should be properly cleaned.

- The EG&G Safe Shutdown committee should be meticulous in the cleanup of the areas specified for closure, especially areas in which explosives were stored or utilized on the explosives side. In addition, several areas in the building, including the area now leased to Star City, the X-ray photographic dark room, and the previous high tech vacuum lab, have or may have chemicals that are no longer used in these specific areas. These chemicals should be monitored, and removed and properly disposed if no longer needed.

- A sink in the X-ray photographic dark room sits on a raised concrete dais with a metal cover, and piping from the photographic development machine appears to be routed into the dais. Our key site manager did not know what features were below the metal cover. It is possible that a sump or subgrade vault exists at this location. The construction, condition, and contents of the area below the metal cover should be investigated.

7.2 HOK/K Industrial, Inc. also has the following recommendations for the site:

- The asbestos-containing materials (ACM) present in Building DS appear to be in relatively good condition and do not represent a significant risk to public health or the environment while left in place. If renovation or demolition of the facility is planned, however, the ACM must be removed in compliance with applicable federal and state regulations.

- Fluorescent light ballasts should be properly disposed.

- Several walls and ceiling areas in Building DS were observed to be covered with flaking and chipping paint. Given the age of the building, there is the potential for this to be lead-based paint, which can represent a serious health risk to Building DS employees. The paint should be tested for lead content and the appropriate removal and cleanup actions should be taken by a licensed lead abatement contractor.

EXHIBIT A

DESCRIPTION OF TWELVE VOLUME SITE SCOPING REPORT

(CAA). Mound Plant, however, conducts its routine operations under the Atomic Energy Act of 1954 (AEA). One of the goals of this report is to ensure that all PRSs are properly evaluated for their inclusion or omission from the ER Program.

1.2. OVERVIEW OF MOUND PLANT SCOPING PROCESS

Prior to signing the FFA, the DOE collected and interpreted data to develop a Site conceptual model to assess both the nature and extent of contamination and to identify potential exposure pathways and potential human and environmental receptors. The multivolume scoping report, compiled under the guidance of the FFA Statement of Work, provides descriptions and summaries of current conditions and characteristics of the Mound Plant Site. The volumes are arranged to provide a systematic data set as follows:

- Volume 1 Groundwater Data: February 1987 - July 1990 (Final February 1992). Provides a tabulation of laboratory reports of groundwater sample analyses from ER Program monitoring wells, plant supply wells and groundwater seeps collected from February 1987 to July 1990, before the FFA became effective.

- Volume 2 Geologic Log and Well Information Report (Final May 1992). Provides a location map, and construction and borehole lithology details for monitoring and production wells on and adjacent to Mound Plant that have been used to collect environmental samples. Selected residential and municipal wells are also included where appropriate.

- Volume 2 Addendum Stratigraphic and Lithologic Logs (Final June 1992). Provides stratigraphic and lithologic information including borehole logs and borehole location maps compiled from plant engineering, planning, and foundation studies and contaminant infiltration and movement investigations.

- Volume 3 Radiological Site Survey (Final June 1993). Provides a summary and tabulation of available radiological data collected at Mound Plant with emphasis on the extensive radiological characterization investigation conducted by Mound Plant during the Site Survey Project (Stought et al. 1988).

- Volume 4 Engineering Map Series (Final February 1992). Provides a series of engineering maps of the Site, including plant utilities, potable water and condensate cooling lines, process piping and tanks, municipal utilities adjacent to the plant, surrounding land uses and easements, adjacent property owners, and copies of the boundary survey conducted in 1982. All maps were reproduced at a scale of 1 inch = 200 ft and use the Ohio State Plane coordinate system.

- Volume 5 Topographic Map Series (Final February 1992). Provides a series of topographic maps of the Mound Plant and adjacent areas, including a topographic map with 2-ft contours, a map of surface water features, a digitized topographic map of the northern part of the site before the plant was constructed in 1946, and a contour map with 10-ft contours that estimates the amounts of cut and fill performed from 1946 to 1986, principally along the plant drainage ditch. All maps were reproduced at a scale of 1 inch = 200 ft and use the Ohio State Plane coordinate system.

- Volume 6 Photo History Report (Final February 1992). Provides a series of interpretive maps compiled from historical aerial photos of Mound Plant that span the years 1959 to 1981. Maps of the upper and lower valley areas were compiled for 1959, 1964, 1968, 1973, 1975, 1979, and 1981, as these areas were known to have been used for waste disposal and experienced significant changes in morphology and terrain elevation.

- Volume 7 Waste Management Report (Final February 1993). Provides a description of the history of ownership and operation of the plant with emphasis on the generation, treatment, storage, and disposal of hazardous wastes through the perspective of the major programs and projects at the plant. Also provides a summary list of the hazardous substances generated through process information. This tabulation was used to compile the list of analytical parameters for the Operable Unit 9 RI/FS (DOE 1993a).

- Volume 8 Environmental Monitoring Data: 1976-1989 (Final February 1992). Provides summaries and tabulations of environmental sampling conducted by Mound Plant as part of the ongoing environmental surveillance program, the Potable Water Standards Project (Dames and Moore 1976a,b) and the Plutonium Soil Inventory Program (MRC 1977). Analytical data included tritium, plutonium-238, uranium-233, uranium-234, and uranium-238 in surface water and silt samples collected from the Great Miami River from 1974 to 1989, tritium in groundwater from the Buried Valley aquifer from 1975 to 1990, and plutonium-238 in regional soils measured in 1977.

- Volume 8 Addendum Vegetation and Foodstuff (Draft March 1994). Provides summary of analytical data on tritium and plutonium-238 concentrations in vegetation (grass) and foodstuff (fish, vegetables and milk) for the years 1972 to 1991. Data was collected and reported as part of the Mound Plant environmental monitoring and surveillance program required by DOE.

- Volume 9 Annotated Bibliography (Final February 1993). Provides an annotated list of reports prepared for the Site prior to the signing of the FFA. The bibliography includes reports prepared by government agencies, subcontractors, scientific journal articles, and maps and drawings that may be relevant to the preparation of the RI/FS. Reports published or compiled since the effective date of the FFA are beyond the scope of Volume 9.

- Volume 10 Permits and Enforcement Actions (Final May 1992). Provides a summary of past and present permits and registrations requested and received by Mound Plant, as well as a summary of enforcement actions. As a government-owned, contractor-operated facility, Mound Plant must operate not only in compliance with Executive Orders and Orders of the DOE, but also with federal and state statutes and regulations, and corporate policies. This report includes only those activities relating to compliance with federal, state, and county environmental regulations and statutes. Conditions of discharges and other permit limitations were beyond the scope of the report. Copies of permits of interest were copied in the appendix of the report.

- Volume 11 Spills and Response Actions (Final March 1992). Provides summaries of past product and hazardous substance spills, including amounts and locations and the response actions conducted. Data were compiled from records and incident reports of the Mound Plant safety office. Limited data were also available from the health physics office. Only incidents that resulted in a spill or an environmental release are included in this report. Laboratory and tabletop accidents, releases that were entirely contained within buildings, and personal injuries and radiation or hazardous substance exposures that did not apparently result in an environmental release were beyond the scope of this report. Summaries of response actions conducted by the EPA and OEPA are also included.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The search met the specific requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-94, or custom distances requested by the user.

The address of the subject property for which the search was intended is:

MOUND ROAD
MIAMISBURG, OH 45343

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the subject property or within the ASTM E 1527-94 search radius around the subject property for the following Databases:

Delisted NPL:	NPL Deletions
RCRIS-TSD:	Resource Conservation and Recovery Information System
CERC-NFRAP:	Comprehensive Environmental Response, Compensation, and Liability Information System
CORRACTS:	Corrective Action Report
SWF/LF:	Licensed Solid Waste Facilities
RAATS:	RCRA Administrative Action Tracking System
RCRIS-SQG:	Resource Conservation and Recovery Information System
RCRIS-LQG:	Resource Conservation and Recovery Information System
HMIRS:	Hazardous Materials Information Reporting System
PADS:	PCB Activity Database System
ERNS:	Emergency Response Notification System
NPL Liens:	Federal Superfund Liens
TSCA:	Toxic Substances Control Act
MLTS:	Material Licensing Tracking System
RODS:	Records Of Decision
CONSENT:	Superfund (CERCLA) Consent Decrees
OH Spills:	Includes Reported Incidents, Spills or Releases to The Environment
Coal Gas:	Former Manufactured gas (Coal Gas) Sites.

Unmapped (orphan) sites are not considered in the foregoing analysis.

Search Results:

Search results for the subject property and the search radius, are listed below:

Subject Property:

The subject property was identified in the following government records. For more information on this property see page 9 of the attached EDR Radius Map report:

US DOE MOUND PLANT MOUND RD MIAMISBURG, OH 45342	CERCLIS FINDS NPL TRIS LUST	OH6890008984

EXECUTIVE SUMMARY

Surrounding Properties:

Elevations have been determined from the USGS 1 degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. EDR's definition of a site with an elevation equal to the subject property includes a tolerance of -10 feet. Sites with an elevation equal to or higher than the subject property have been differentiated below from sites with an elevation lower than the subject property (by more than 10 feet). Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already by listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data comes from the Ohio Environmental Protection Agency's Master Sites List.

A review of the State Haz. Waste list, as provided by EDR, and dated 12/31/1995 has revealed that there is 1 State Haz. Waste site within approximately 1 Mile of the subject property.

Lower Elevation	Address	Map ID	Page
MIAMISBURG WELL FIELD / UNK SO	302 S RIVERVIEW AVE	7	17

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data comes from the Department of Commerce Division of State Fire Marshal's List of Reported Petroleum Underground Storage Tank Release Incidents.

A review of the LUST list, as provided by EDR, and dated 04/01/1996 has revealed that there are 5 LUST sites within approximately 0.5 Miles of the subject property.

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data comes from the Department of Commerce Division of State Fire Marshal's Facility File.

A review of the UST list, as provided by EDR, and dated 07/16/1996 has revealed that there is 1 UST site within approximately 0.25 Miles of the subject property.

SUMMARY

GEOLOGIC AGE IDENTIFICATION†

Geologic Code:	O3
Era:	Paleozoic
System:	Ordovician
Series:	Upper Ordovician (Cincinnatian)

ROCK STRATIGRAPHIC UNIT†

Category:	Stratified Sequence

GROUNDWATER FLOW INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, including well data collected on nearby properties, regional groundwater flow information (from deep aquifers), or surface topography.‡

General Topographic Gradient: General North
General Hydrogeologic Gradient: No hydrogeologic data available.

EPA Waste Codes Addendum

Code	Description
D001	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM RECORDS:

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA/NTIS
Telephone: 703-603-8904
CERCLIS: CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 03/31/96
Date Made Active at EDR: 06/03/96
Database Release Frequency: Monthly
Date of Data Arrival at EDR: 04/23/96
Elapsed ASTM days: 41
Date of Last EDR Contact: 07/17/96

ERNS: Emergency Response Notification System
Source: EPA/NTIS
Telephone: 202-260-2342
ERNS: Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/95
Date Made Active at EDR: 02/19/96
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 01/26/96
Elapsed ASTM days: 24
Date of Last EDR Contact: 08/12/96

NPL: National Priority List
Source: EPA
Telephone: 703-603-8852
NPL: National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, it is EDR's policy to plot NPL sites greater than approximately 300 acres in size as areas (polygons). A polygon boundary is based upon EPA's defined Area of Impact (AOI) for the particular NPL site. The AOI may be the boundaries of the property, the boundaries as determined by the extent of plume migration, or other such boundaries as defined by EPA. Sites smaller in size are point-geocoded at the site's address.

Date of Government Version: 06/01/96
Date Made Active at EDR: 07/17/96
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 06/25/96
Elapsed ASTM days: 22
Date of Last EDR Contact: 06/19/96

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 703-308-7907
RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 07/01/96
Date Made Active at EDR: 10/09/96
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 08/07/96
Elapsed ASTM days: 63
Date of Last EDR Contact: 06/05/96

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

FEDERAL NON-ASTM RECORDS:

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: Varies
Database Release Frequency: Varies
Date of Last EDR Contact: Varies
Date of Next Scheduled EDR Contact: 09/01/95

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 703-308-7907
CORRACTS: CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 04/10/95
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 09/27/96
Date of Next Scheduled EDR Contact: 12/16/96

FINDS: Facility Index System
Source: EPA/NTIS
Telephone: 800-908-2493
FINDS: Facility Index System. FINDS contains both facility information and "pointers" to other sources that contain more detail. These include: RCRIS, PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]), CERCLIS, DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), FRDS (Federal Reporting Data System), SIA (Surface Impoundments), CICIS (TSCA Chemicals in Commerce Information System), PADS, RCRA-J (medical waste transporters/disposers), TRIS and TSCA.

Date of Government Version: 09/30/95
Database Release Frequency: Quarterly
Date of Last EDR Contact: 06/05/96
Date of Next Scheduled EDR Contact: 10/07/96

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
HMIRS: Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 12/31/95
Database Release Frequency: Annually
Date of Last EDR Contact: 07/29/96
Date of Next Scheduled EDR Contact: 10/28/96

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 02/13/96
Database Release Frequency: Quarterly
Date of Last EDR Contact: 07/15/96
Date of Next Scheduled EDR Contact: 10/14/96

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4267
NPL LIENS: Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 09/10/96
Date of Next Scheduled EDR Contact: 11/25/96

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-260-3992
PADS: PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 10/14/94
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 08/21/96
Date of Next Scheduled EDR Contact: 11/18/96

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RAATS: RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA.

Date of Government Version: 04/17/95
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 09/16/96
Date of Next Scheduled EDR Contact: 12/16/96

ROD: Records Of Decision
Source: NTIS
Telephone: 703-416-0703
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 03/31/95
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 06/07/96
Date of Next Scheduled EDR Contact: 12/02/96

TRIS: Toxic Chemical Release Inventory System
Source: EPA/NTIS
Telephone: 202-260-2320
TRIS: Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/92
Database Release Frequency: Annually
Date of Last EDR Contact: 09/11/96
Date of Next Scheduled EDR Contact: 09/30/96

TSCA: Toxic Substances Control Act
Source: EPA/NTIS
Telephone: 202-260-1444
TSCA: Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. USEPA has no current plan to update and/or re-issue this database.

Date of Government Version: 01/31/95
Database Release Frequency: Annually
Date of Last EDR Contact: 09/16/96
Date of Next Scheduled EDR Contact: 12/16/96

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

STATE OF OHIO ASTM RECORDS:

LUST: List of Reported Petroleum Underground Storage Tank Release Incidents
Source: Department of Commerce
Telephone: 614-752-7926
LUST: Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 04/01/96
Date Made Active at EDR: 06/06/96
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 04/25/96

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Historical and Other Database(s)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

DELISTED NPL: Delisted NPL Sites
Source: EPA
Telephone: 703-603-8769
DELISTED NPL: The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

NFRAP: No Further Remedial Action Planned
Source: EPA/NTIS
Telephone: 703-416-0702
NFRAP: As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

FRDS: Federal Reporting Data System
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
FRDS provides information regarding public water supplies and their compliance with monitoring requirements, maximum contaminant levels (MCL's), and other requirements of the Safe Drinking Water Act of 1986.

Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals who, due to their fragile immune systems, are deemed to be especially sensitive to environmental discharges. These typically include the elderly, the sick, and children. While the exact location of these sensitive receptors cannot be determined, EDR indicates those facilities, such as schools, hospitals, day care centers, and nursing homes, where sensitive receptors are likely to be located.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1994 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The search met the specific requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-94, or custom distances requested by the user.

The address of the subject property for which the search was intended is:

OFF MOUND RD.
MIAMISBURG, OH 45432

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the subject property or within the ASTM E 1527-94 search radius around the subject property for the following Databases:

Delisted NPL:	NPL Deletions
RCRIS-TSD:	Resource Conservation and Recovery Information System
CERC-NFRAP:	Comprehensive Environmental Response, Compensation, and Liability Information System
CORRACTS:	Corrective Action Report
State LF:	Licensed Solid Waste Facilities
RAATS:	RCRA Administrative Action Tracking System
HMIRS:	Hazardous Materials Information Reporting System
ERNS:	Emergency Response Notification System
NPL Liens:	Federal Superfund Liens
TSCA:	Toxic Substances Control Act
MLTS:	Material Licensing Tracking System
RODS:	Records Of Decision
CONSENT:	Superfund (CERCLA) Consent Decrees
OH Spills:	Not reported
Coal Gas:	Former Manufactured gas (Coal Gas) Sites

Unmapped (orphan) sites are not considered in the foregoing analysis.

Search Results:

Search results for the subject property and the search radius, are listed below:

Subject Property:

The subject property was not listed in any of the databases searched by EDR.

EXECUTIVE SUMMARY

Surrounding Properties:

Sites with an elevation equal to or higher than the subject property are in the left hand column; those with a lower elevation are in the right hand column. Page numbers refer to the EDR Radius Map report where detailed data on individual sites may be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 09/01/1995 has revealed that there is 1 NPL site within approximately 1.33 Miles of the subject property.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 07/27/1994 has revealed that there are 3 FINDS sites within approximately 0.33 Miles of the subject property.

GEOCHECK VERSION 2.1
SUMMARY

GEOLOGIC AGE IDENTIFICATION†

Geologic Code:	O3
Era:	Paleozoic
System:	Ordovician
Series:	Upper Ordovician (Cincinnatian)

ROCK STRATIGRAPHIC UNIT†

Category:	Stratified Sequence

GROUNDWATER FLOW INFORMATION

General Topographic Gradient:	General North
General Hydrogeologic Gradient:	The hydrogeologic data for this report indicates that groundwater flow generally is to the South. However, because of the number and/or location of wells, the various depths of aquifers or other insufficient data, the direction of groundwater flow is uncertain.

Note: In a general way, the water table typically conforms to surface topography.‡

EPA Waste Codes Addendum

Code	Description
D000	NOT DEFINED
D001	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
D002	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
D003	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
F001	THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F002	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F003	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F004	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: CRESOLS AND CRESYLIC ACID, AND

EPA Waste Codes Addendum

Code	Description
	NITROBENZENE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F005	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM RECORDS:

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA/NTIS
Telephone: 703-416-0702
CERCLIS: CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 08/31/95 — Date of Data Arrival at EDR: 11/02/95
Date Made Active at EDR: 12/04/95 — Elapsed ASTM days: 32

ERNS: Emergency Response Notification System
Source: EPA
Telephone: 202-260-2342
ERNS: Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/94 — Date of Data Arrival at EDR: 04/11/95
Date Made Active at EDR: 05/25/95 — Elapsed ASTM days: 44

NPL: National Priority List
Source: EPA
Telephone: 703-603-8852
NPL: National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, it is EDR's policy to plot NPL sites greater than approximately 500 acres in size as areas (polygons). Sites smaller in size are point-geocoded at the site's address.

Date of Government Version: 09/01/95 — Date of Data Arrival at EDR: 10/17/95
Date Made Active at EDR: 10/25/95 — Elapsed ASTM days: 8

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 703-308-7907
RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 05/31/95 — Date of Data Arrival at EDR: 06/28/95
Date Made Active at EDR: 08/22/95 — Elapsed ASTM days: 55

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

FEDERAL NON-ASTM RECORDS:

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: Varies — Date of Next Scheduled Update: 09/01/95

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 703-308-7907
CORRACTS: CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 04/10/95 — Date of Next Scheduled Update: 12/18/95

FINDS: Facility Index System
Source: EPA/NTIS
Telephone: 800-908-2493
FINDS: Facility Index System. FINDS contains both facility information and "pointers" to other sources that contain more detail. These include: RCRIS, PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]), CERCLIS, DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), FRDS (Federal Reporting Data System), SIA (Surface Impoundments), CICIS (TSCA Chemicals in Commerce Information System), PADS, RCRA-J (medical waste transporters/disposers), TRIS and TSCA.

Date of Government Version: 07/27/94 — Date of Next Scheduled Update: 01/08/96

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
HMIRS: Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 12/31/94 — Date of Next Scheduled Update: 04/30/96

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 08/01/95 — Date of Next Scheduled Update: 01/15/96

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 202-260-8969
NPL LIENS: Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91 — Date of Next Scheduled Update: 02/26/96

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-260-3992
PADS: PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 10/14/94 — Date of Next Scheduled Update: 02/19/96

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RAATS: RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA.

Date of Government Version: 04/17/95 Date of Next Scheduled Update: 12/18/95

ROD: Records Of Decision
Source: NTIS
Telephone: 703-416-0703
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 03/31/95 Date of Next Scheduled Update: 03/04/96

TRIS: Toxic Chemical Release Inventory System
Source: EPA/NTIS
Telephone: 202-260-2320
TRIS: Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/92 Date of Next Scheduled Update: 04/12/96

TSCA: Toxic Substances Control Act
Source: EPA/NTIS
Telephone: 202-260-1444
TSCA: Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. USEPA has no current plan to update and/or re-issue this database.

Date of Government Version: 01/31/95 Date of Next Scheduled Update: 03/18/96

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

STATE OF OHIO ASTM RECORDS:

LUST: List of Reported Petroleum Underground Storage Tank Release Incidents
Source: Department of Commerce
Telephone: 614-752-7926
LUST: Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 11/01/95
Date Made Active at EDR: 12/05/95
Date of Data Arrival at EDR: 11/06/95
Elapsed ASTM days: 29

SHWS: Master Sites List
Source: Ohio Environmental Protection Agency
Telephone: 614-644-3143
SHWS: State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 04/01/95
Date Made Active at EDR: 05/16/95
Date of Data Arrival at EDR: 04/24/95
Elapsed ASTM days: 22

SWF/LS: Licensed Solid Waste Facilities
Source: Ohio Environmental Protection Agency
Telephone: 614-644-2621
SWF/LS: Solid Waste Facilities/Landfill Sites. SWF/LS type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Section 2004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 04/22/95
Date Made Active at EDR: 07/27/95
Date of Data Arrival at EDR: 06/26/95
Elapsed ASTM days: 31

UST: Facility File
Source: Department of Commerce
Telephone: 614-752-7926
UST: Registered Underground Storage Tanks. UST's are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA) and must be registered with the state department responsible for administering the UST program. Available information varies by state program.

Date of Government Version: 09/01/95
Date Made Active at EDR: 10/10/95
Date of Data Arrival at EDR: 09/18/95
Elapsed ASTM days: 22

STATE OF OHIO NON-ASTM RECORDS:

SPILLS: Inclused Reported Incidents, Spills or Releases to The Environment
Source: Ohio EPA
Telephone: 614-644-2084
SPILLS: All reported incidents, spills or releases to the environment.

Date of Government Version: 12/31/93
Date of Next Scheduled Update: 12/18/95

Historical and Other Database(s)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. DELISTED NPL: Delisted NPL Sites
Source: EPA
Telephone: 703-603-8769
DELISTED NPL: The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

NFRAP: No Further Remedial Action Planned
Source: EPA/NTIS
Telephone: 703-416-0702
NFRAP: As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

FRDS: Federal Reporting Data System
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
FRDS provides information regarding public water supplies and their compliance with monitoring requirements, maximum contaminant levels (MCL's), and other requirements of the Safe Drinking Water Act of 1986.

Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals who, due to their fragile immune systems, are deemed to be especially sensitive to environmental discharges. These typically include the elderly, the sick, and children. While the exact location of these sensitive receptors cannot be determined, EDR indicates those facilities, such as schools, hospitals, day care centers, and nursing homes, where sensitive receptors are likely to be located.

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1994 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

Within each category (in service, inactive, closed in place and removed), there are USTs which are subject to CWA and AEA jurisdiction. Since UST operating, monitoring, and closure requirements are not specifically defined in either the CWA or AEA, RMPs have been developed to reduce the potential for an uncontrolled release from tanks under these jurisdictions.

Based on the information reviewed, AUSTs are being operated, maintained or closed consistent with current regulatory requirements. Section 6.0 of the AUSTP describes several RMPs which need to be carried out to ensure future compliance.

4.1 In Service AUSTs

The In Service USTs have been assigned to the AUST program. In Service AUSTs are those currently in use or available for use in routine Mound facility operations. A field survey of each operating AUST system was conducted in February, 1994.

Physical features such as tank and piping construction, installation date, contents, operational use, and release prevention and detection systems were identified and evaluated. Copies of field survey sheets are provided in Appendix C.

Based on the field surveys, and a review of available engineering drawings and maintenance records, a regulatory compliance assessment was performed for each In Service tank system. The CWA and AEA do not specifically define operating, upgrading, or closure requirements for USTs. Therefore, the general operating and release detection requirements for USTs under RCRA (40 CFR Part 280 Subparts C and D) and BUSTR (OAC 1301:7-9-07 and 1301:7-9-08) were used as a guide in evaluating systems performance under these jurisdictions. However, compliance with these regulations is not required.

Building managers are responsible for assuring that systems in their buildings are run and maintained in accordance with SOPs. Table 4-2 summarizes evaluation results for In Service AUSTs and identifies actions for those systems to be modified.

TABLE 4-2

EVALUATION OF IN SERVICE AUSTs

AUST NO.	DESCRIPTION	STATUS	ACTION
1 and 258	Collection of used fire water from HEPA filter banks (emergency use only).	AEA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
3 through 18	Used in processing of radioactive wastewater in WD building.	AEA or CWA tanks. Operated and maintained in accordance with current SOPs.	See Section 6 for discussion of RMP modifications.
19 through 22 and 24	Collection of radioactive wastewater.	AEA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
25 through 27	Sumps used in collection and transfer of radioactive wastewater.	AEA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
28 and 29	Collection of decon water from medical showers.	AEA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
100, 120 and 254	Used for temporary holding of sanitary wastewater.	CWA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
101 through 112	Chambers and basins used in sanitary wastewater processing.	CWA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
113 through 116	Fuel oil storage tanks.	Operated and maintained in accordance with current requirements.	Scheduled for removal in May, 1995.

TABLE 4-2

EVALUATION OF IN SERVICE AUSTs

AUST NO.	DESCRIPTION	STATUS	ACTION
117, 118 and 121	Diesel fuel storage.	BUSTR tanks. Operated and maintained in accordance with current requirements.	See Section 6 for planned actions to comply December, 1998 BUSTR leak detection requirements.
119	Metal plating rinse tank.	CWA tank. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
124 through 135	Sumps used for collection of sanitary wastewater and cooling water.	CWA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
263 through 265	Tanks used as noise dampeners from explosives testing.	RCRA tanks. Included as part of Mound Part B application.	No modifications planned or necessary.
268 and 269	Condensate sumps from heating systems in T and H buildings.	CWA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.
271 through 273	Collection of water from fire sprinkler system.	AEA tanks. Operated and maintained in accordance with current SOPs.	No modifications planned or necessary.

4.2 Inactive Tanks

Inactive tanks are surplus systems which are still present on the site but are no longer in use and are not likely to be used. A field survey and drawing/records review was also conducted for these USTs with a copy of survey results provided in Appendix C. Table 4-3 provides a summary of the evaluation and identifies the program responsible for the removal or closure of these systems.

TABLE 4-3

EVALUATION OF INACTIVE TANKS

AUST NO.	DESCRIPTION	STATUS	ACTION
2, 23	Sump for radioactive waste water.	AEA Tank No modifications planned or needed.	To be scheduled for inclusion in D&D Program.
205 through 207, and 214 through 216	Sumps and tanks used for collection of radioactive and sanitary waste water.	To be addressed as part of OU6.	D&D Program
136, 200, 201, 217, and 218	Sumps, tanks and basins used in solvent and fuel storage.	To be addressed as part of OU5.	FFA Program
225	Metal plating rinse sump.	To be addressed as part of OU2.	FFA Program
226	Sump used for collection of radioactive waste water.	AEA Tank No modifications planned or needed.	To be scheduled for inclusion in D&D Program.
236	Beta wastewater sump	AEA Tank No modifications planned or needed.	To be scheduled for inclusion in D&D Program.
262	Storage of waste oil.	AEA Tank No modifications planned or needed.	To be scheduled for inclusion in D&D program.
255, 266	Calorimeter bath.	AEA Tanks No modifications planned or needed.	To be scheduled for inclusion in D&D Program.
267	Low risk waste tank.	AEA Tank No modifications planned or needed.	To be scheduled for inclusion in D&D Program.
270	Former septic tank.	AEA Tank No modifications planned or needed.	To be scheduled for inclusion in D&D program.

UST removals and closures will be performed within the ER or D&D programs. Following removal of D&D tanks, final site assessment and closure verification will be performed. OU6 has been designated for D&D closure verification.

Some inactive tanks are sumps or containments which are part of the physical structure of a building still in use. These sumps or containments will not be removed until the building in which they are present is permanently decommissioned. Tanks within this category are recommended for inclusion in D&D program and will be maintained in the AUST database until plans to decommission the building or remove and close the UST have been specifically identified.

Potential releases to the environment will be investigated and mitigated as part of the closure of these systems in accordance with the governing regulatory authority. Corrective actions will be coordinated in order to maintain consistency (e.g., cleanup standards) among the various regulatory authorities.

4.3 Closed In Place/Removed Tanks

Table 4-4 lists those tanks that have been closed in place (e.g. filled with concrete) and those that have been physically removed. Documentation for these tanks has been reviewed to verify that closure was or is being performed in accordance with applicable regulations. Copies of field survey and evaluation sheets are provided in Appendix B.

14 USTs are listed on Table 4-4 as closed. These are tanks upon which preliminary D&D activities (such as rendering the interior of the tank inert by filling with concrete or gravel) have taken place. These activities are intended to serve as interim measures to allow reuse of an area or to reduce the potential for a release of radiological constituents. The USTs for which interim measures have been taken are not considered closed until final action has been taken consistent with the appropriate regulatory program.

TABLE 4-4

EVALUATION OF CLOSED IN PLACE/REMOVED TANKS

AUST NO.	DESCRIPTION	STATUS	ACTION
202 through 204	Gasoline storage tanks (removed in 1986).	To be addressed as part of OU2.	FFA Program
208 through 213	Radioactive wastewater tanks (removed various dates).	To be addressed as part of OU6.	D&D Program
219, 220	Aviation fuel and waste storage (removed).	To be addressed as part of OU5.	FFA Program
222, 223	Diesel fuel storage (removed in 1989).	To be addressed as part of OU2.	FFA Program
224	Septic tank (closed in place).	To be addressed as part of OU5.	FFA Program
227 through 235	Septic tanks and basins used in solvent and fuel storage.	Closed in place.	To be scheduled for inclusion in D&D program.
237	Alpha wastewater sump.	Closed in place.	To be scheduled for inclusion in D&D program.
238 through 240	Gasoline storage tanks (removed).	To be addressed as part of OU5.	FFA Program
241	Septic tank (removed).	To be addressed as part of OU6.	D&D Program
250, 251	T Building wastewater sumps (closed).	Closed in place.	To be scheduled for inclusion in D&D Program.
260	Fuel oil storage (removed).	OU not yet assigned.	Recommended for inclusion in ER program.
261	Septic tank.	Closed in place.	To be scheduled for inclusion in D&D Program.

In Service and Inactive USTs whose primary regulatory jurisdiction is the AEA will be considered closed when D&D has finished its cleanup activities and closure verification is completed within the scope of OU6.

In Service and Inactive USTs whose primary regulatory jurisdiction is CWA will be considered when the systems are taken out of service, disconnected and cleaned, and are not intended to be returned to service.

Closure of USTs subject to the CWA and AEA will incorporate CERCLA verification soil sampling if evidence of leakage or known historical leakage exists. If leakage has occurred, sampling for the current and historic chemical and/or radionuclide constituents will be performed. CERCLA verification sampling will address other potential contaminants and provide confirmation that the soil no longer contains contamination from the tank. Excavations will remain open until receipt of validated CERCLA verification sampling results. Closure reports will be compiled but do not require USEPA or OEPA approval. Closure reports will be provided to regulatory agencies as requested.

Some tanks which have been closed in place are sumps or containments which are part of the physical structure of a building still in use. These tanks will not be removed until the building in which they are present is permanently decommissioned. USTs of this type are recommended for inclusion in the ER or D&D programs and will be maintained in the AUST data base until plans to decommission the building or remove and close the UST have been specifically identified in the appropriate program plan.

EXHIBIT F

BUILDING DS WASTE MANAGEMENT INFORMATION

The lithium hydride stability studies involved the use of furnaces capable of high-temperature operation under controlled atmospheres. These studies were also performed in a dry box. The development of analytical methods for lithium hydride, deuteride, and tritide focused on the following analytes: Kjeldahl nitrogen; total hydrogen, deuterium, and tritium; lithium isotopic ratios; carbon, hydroxide, chloride, oxygen, sodium, potassium, and calcium; and free and isotopic lithium (Rhinehammer 1965).

2.15.2. Waste Generation

Compared with the size of the programs, the wastes generated by them were few. Lithium metal, lithium hydride, deuteride, tritide, hydrogen, deuterium, and tritium represent the majority of the waste produced in these studies. The analytical methods development work used methanol, sulfuric and hydrofluoric acids, ethylbromide, Karl Fisher reagent, tin, mercury, hydrochloric acid, sliver nitrate, hydroiodic acid, barium hydroxide, and Nessler reagent.

Based on activity levels, tritium-contaminated aqueous wastes would be treated and disposed of as discussed in the tritium section. Gaseous waste containing hydrogen, tritium, and deuterium would be sent to the effluent removal system to recover tritium.

Lithium metal, lithium hydride, and deuteride are extremely reactive metals and had to be reacted with water to produce a waste that could be stored or undergo further treatment. The disposal of such wastes reportedly took place at Mound. In the mid-1950s, lithium hydride materials were reported as being disposed of by burning in the swampy area along the lower reach of the plant drainage ditch. The highly reactive materials were simply reacted with the water and allowed to burn. This area was referred to as Area C in the CEARP Installation Assessment (DOE 1986). After Building 34 was constructed in the mid-1960s, the disposal activity was moved to the standing water pond at the historic landfill site, known as Area B (DOE 1992g). Any associated contamination at these areas would be dependent on the effectiveness of the isotope separation operation.

2.16. DETONATORS AND EXPLOSIVES

In July 1955, plans and proposals were prepared for a detonator facility to be constructed at Mound. Plans were made to use Building I for explosive manufacturing, and Building B was to be used for inert manufacturing (Brawley 1955). In August 1956, Mound was directed to begin work on detonator assemblies required for the weapons program (MCC 1960). Thus began a long-lived program in the development and production of detonators, igniters, and actuators; in the research, development, and manufacture of pyrotechnic material and devices; and in the surveillance testing of explosive components. These programs involved research and development of plastic, adhesive, and ceramic

materials. Research, production, and testing included devices containing small quantities of energetic materials. The program began in the E, I, and SW buildings. In E Building, the plastics development program involved process improvement studies, new material investigations, evaluation of commercially produced plastic, and adhesive chemistry studies. In addition, detonator pilot plant operations and physical studies of high explosives were carried out. The detonator program was expanded into the SW Building in 1960. Explosive manufacturing was planned to take place in the I Building.

In 1961, the explosive program undertook the study of explosive purification. This program as conducted in Building 1 (Rhinehammer 1961).

2.16.1. Process Descriptions

2.16.1.1. Plastics Research

Plastics research at Mound conducted in the late 1950s and early 1960s was directed toward the development of a process for blending diallyl phthlalate powders and filler materials into resins whose chemical and physical properties met certain performance standards and could be molded easily. Asbestos fibers, micas and china clays, and man-made materials such as Dacron were evaluated. Various pigments such as titanium dioxide were also evaluated (Eichelberger 1961a). The process involved formulation, followed by injection molding and physical testing of the finished products. Testing included tensile strength, impact resistance, and residual volatile contents. Formulations typically included Dapon 35, ter-butyl perbenzoate, benzoyl peroxide, 10-undecenoic acid, and acetone. Typical batches ranged from 15 g to 15 pounds (Eichelberger 1961b).

2.16.1.2. Adhesives Research

In the early 1960s, research conducted on adhesives was directed toward the reevaluation of all previous work on polyurethane and polyurathane-epoxy copolymer systems. Dozens of formulations were studied throughout the program, including effects of polyol content on epoxy-modified polyurethanes and the effects of di-epoxide modifiers on polyurethanes and the adiprene-ferric acetyl acetonate-polyol systems. The polyols used were typically 1,3-butanediol, 1,4-butanediol, 1,2,6-hexanetriol, 1,5-pentanediol, and 1,1,1-trimethylolpropane. Normal formulations required 20 to 30 g of Adiprene resin and 0.02 to 0.2 g of catalysts. Many formulations of commercial adhesives and epoxy compounds were evaluated. Some required solvents such as methyl ethyl ketone. Other amine curing agents, such as 4,4-methylene-bis-(2-chloroanilene), also known as MOCA, were also used. The adhesive formulations were evaluated for elastomer properties, cure times, pot life, viscosity, and application characteristics (Eichelberger 1961b).

2.16.1.3. Transducers and Plastic Component Production

Mound produces transducers, plastic components, and inert plastic elements of detonators. Parts are cleaned in ultrasonic baths using trichloroethylene. Spent solvent is poured into a sink that drains to a waste solvent drum located in a shed attached to the building. Other organic solvents such as ethyl and isopropyl alcohols, toluene, and trichloroethane are also used for cleaning parts. Methyl, ethyl, and isopropyl alcohols are used to clean actuators parts. After use, they are transferred to waste drums located in an approved storage shed. Freon TF is also used as a cleaning and degreasing solvent, and the waste Freon is kept in a separate 5-gallon container in an approved storage shed.

Plastic molding activity also involves ultrasonic cleaning of components using Freon TE, Freon TF, and ethyl alcohol. Water from ultrasonic baths is drained to waste solvent drums stored in an approved storage area.

2.16.1.4. Pyrotechnic and Tape Development

Small quantities of pyrotechnic and explosive-containing wastes and organic solvent wastes are generated by pyrotechnic and tape development activities. Tape production involves a photoresist process, which generates aqueous waste streams containing sodium carbonate, ferric chloride, potassium hydroxide, and the photoresist that is chemically removed from the tape. These wastes are discharged to the sanitary sewer system. The tape is then plated with nickel. The plating solutions used in this process contain nickel sulfamate and sulfuric acid. After using the sulfuric acid cleaning solution and nickel sulfamate plating solution, they are returned to their original containers for reuse. Throughout this process, ethyl alcohol is used to clean tapes. Gold cyanide is used when tapes are gold-plated.

2.16.1.5. Energetic and Low-Energy Component Development

In this area, research and development work involves the use of primary, secondary, and special explosives to fabricate low-energy and energetic components. In addition to the explosive elements used in this activity, numerous organic solvents are used in small quantities. These solvents include ethyl and isopropyl alcohol, acetone, toluene, Freon, and trichloroethane.

2.16.1.6. Explosive Processing

Energetic materials may be classified as explosives, propellants, and pyrotechnics. Various high or secondary explosives, such as pentaerythritol tetranitrate (PETN), plastic bonded explosives (PBX), and tetryl, are used in development and manufacturing programs. The production of explosives involves a recrystallization process wherein the explosive is dissolved in a suitable solvent such as acetone or ethyl alcohol and water is added to the solution to allow fractional crystallization. The recrystallized explosive is filtered and washed with water. The major reagents used in this process are acetone, ethanol, dimethylsulfoxide, and dimethylformamide.

The management of waste energetic materials at Mound is described in *Destruction of Energetic Waste Materials* (EG&G 1990). This manual describes procedures for segregating wastes by groups, for packaging wastes destined for treatment in the retort, and for treatment by other thermal processes. Energetic waste materials are separated and classified into one of the following groups:

Group 1 contains explosive-contaminated flammable materials such as paper, wood, cardboard, plastic, air filters, etc.

Group 2 contains fabricated components and assemblies such as pellets, loaded cups, subassemblies, detonators, and surveillance-generated explosive waste.

Group 3 contains loose bulk materials such as PETN, PBX, hexahydro-1,3,5-trinitro-s-triazine cyclotetramethylene-tetranitramine (RDX), octahydro-1,3,5,7-tetranitro-1,3,5,6-tetrazocineyclo-tetramethylenetetranitramine (HMX), and tetryl.

Group 4 contains mild detonating materials, including mild detonating fuses and mild detonating cord.

Group 5 contains pyrotechnic powder and scrap or solid waste contaminated with pyrotechnic materials.

Group 6 contains hexanitrostilbene (HNS) and HNS-contaminated waste material.

Group 7 contains 2-(5-cyanotetrazolato)pentaamine, cobalt (III) perchlorate (CP), bulk CP, CP-contaminated materials, and CP components.

Group 8 contains thermite scrap and thermite-contaminated waste.

Group 9 contains primary explosives and primary explosive-contaminated waste.

Group 10 contains propellants and associated wastes.

Group 12 contains nonburnable explosive assemblies, such as timers.

Group 13 contains experimental and laboratory energetic material and explosive devices.

Group 14 contains waste energetic materials in solution/solvents.

Wastes belonging to Groups 1, 2, 3, 4, 7, 9, and 13, as described above, are destined for treatment in the retort.

2.16.2. Waste Generation

The majority of the wastes generated in association with explosive and related developmental and production activities are organic solvents and aqueous mixtures of these solvents. Organic solvents include trichloroethene; trichloroethane; methyl, ethyl and isopropyl alcohols; toluene; and acetone. Other chemicals include Freon TF, Freon TE, sodium carbonate, ferric chloride, potassium hydroxide, nickel sulfamate, sulfuric acid, and cyanide solutions. Metals involved include titanium, nickel, copper, and gold. Historically, the aqueous solutions containing organic solvents, mostly acetone, were released to leach pits and allowed to evaporate and disintegrate naturally. Since the mid-1980s, the solutions have been drummed and handled through the hazardous waste storage area. These solvent wastes are transferred to 55-gallon drums and 5-gallon cans and stored until the containers are full. Waste solvents are recycled or incinerated at off-plant facilities. Aqueous wastes containing ferric chloride and potassium hydroxide are allowed to discharge to the sanitary sewer system. Nickel and gold plating and wastes from photographic processing are collected and picked up by Mound waste management personnel for packaging and disposal. Photographic wastes receive pretreatment to recover silver before being picked up by waste management personnel. The organic solvent waste from the fractional crystallization of PETN, known as "27 waste solvent," was drained to an open trough, and the liquid was filtered. The filtrate was picked up by waste management personnel and handled as hazardous waste. Surplus explosives are burned in the thermal treatment unit.

The adhesives programs evaluated a wide range of chemicals including Adiprene 100, 167, 213; polyethylene glycol; MOCA; aliphatic epoxy resins; polypols including 1,3-butanediol, 1,4-butanediol, 1,2,6-hexanetriol, 1,5-pentanediol, and 1,1,1-trimethylolpropane; Versamid 140; Epon 812; dipentive dioide; and butanediol diglycidl ether, as well as other plastic polymers (e.g., 3,4-epoxy-6-methylcyclohexylmethyl-3,4-epoxy-6-methylcyclohexanecarboxylate and 1,4,5,6,7,7-hexachlorobicyclo-[2.2]-5-hepthane-2,3 dicarboxylic anhydride). Adhesive wastes were generally disposed of in the normal trash after testing, as were the excess volumes from production facilities. Solvent vapors were simply vented to the atmosphere.

5.3.4. Building 28 Solvent Storage Area

The Building 28 solvent storage area is a sheet metal building on a concrete pad located on the east side of Building 28, on the Main Hill, in the north-central portion of Mound (Figure 5.1). Historically, waste solvents were pumped from Building 28 into drums located on a concrete pad on the south side of the building. There was no curbing or controls to contain releases. In 1990, a solvent storage building was constructed to contain the drums. Solvents used in Building 28 are now stored in the new building. The solvents consist of alcohol, acetone, and dichloromethane. The alcohol and dichloromethane are pumped from drums into Building 28 through stainless steel lines. The acetone is stored in bottles. Once used in the building, the solvents are returned through copper lines to waste drums in the solvent storage shed. The drums are equipped with sensors to automatically shut off the solvent flow when full (Koons 1991). Drummed waste solvent is transferred as required to the hazardous waste storage area in Building 72 near the western edge of the Mound boundary (MRC 1983). In 1989, approximately 800 gallons of waste solvents were generated in Building 28 (Fentiman 1990).

5.3.5. DS Building Solvent Storage Shed

The DS Building solvent storage shed is on the east side of DS Building on the Main Hill, in the north-central portion of Mound (Figure 5.1). The shed was built in the early 1970s and is still in operation. The shed is a completely enclosed structure of approximately 10 ft by 10 ft, with a 12-ft ceiling equipped with a fan for ventilation. It has a concrete floor and a sealed drain with an unknown point of discharge, although a storm drain is near the shed. The concrete floor is curbed and covered with a metal grate. The curbing was not installed until 1987, at which time the drain was sealed. Historically, solvents were stored in 5-gallon cans within the building and picked up and delivered by laborers. The shed now receives waste solvent from the DS Building and also contains product-grade solvent to be used in the building. Waste solvent is pumped from the DS Building into sealed 55-gallon drums in the storage shed through automatic discharge hoses that are equipped with automatic shutoff devices. During a 1990 site visit, two drums of waste solvents composed of 1,1,1-trichloroethane, trichlorofluoromethane, and trichloroethene; and product-grade solvents including one drum of 1,1,1-trichloroethane, two drums of trichlorofluoromethane, and one drum of ethyl alcohol, were found (DOE 1992g). Drummed waste solvent is transferred as required to the hazardous waste storage area in Building 72 near the western edge of the Mound boundary (MRC 1983).

Table VI.4. (page 2 of 2)

Waste Stream	Waste Stream Description	1988 Volume[a]	1989 Volume[a]
38	Stoddard solvent (new)	0	55 gal
39	LIX solvent	0	55 gal
40	Oil and water	495 gal	55 gal
41	Oil and solvents	55 gal	55 gal
42	Nickel chloride	0	55 gal

Wastes for which 1989 Volume was Less Than 50 Gallons but Greater Than 10 Gallons	
Alodine waste	Maleic anhydride
Copper cyanide	MOCA waste
Dichloromethane	Oakite
Electroless nickel	Passivating waste
Lead waste	

Wastes for which 1989 Volume was 10 Gallons or Less	
Acetone and absorbent	
Acetone and asbestos	Gold waste
Acetone and trichloroethane	Grease
Alcohol and ethyl acetate	Isocyanate cleanup material
Alcohol and freon	Mercury
Alcohol and trichloroethane	Methyl ethyl ketone
Aluminum waste	Nitric acid and nickel
Benzene	Nitric acid and zinc chromate
Blankrola	Oil cleanup material
Carbon disulfide	Oil and mercury
Chromic acid	Propylene glycol
Cyclohexane	"R" solvent[k]
"DS" solvent[j]	Sodium dichromate
Ethyl acetate	Tricholoromethane
Ethylene glycol	Trichloroethene
Formaldehyde	Zinc chromate

Ref.: Fentiman 1990

[a]All volumes are approximate. Waste cans and drums are often not full when they are picked up. Sometimes an estimated volume of waste is recorded on the pickup sheet and sometimes the container volume is used.

[b]Contents include acetone, acetonitrile, ethyl and isopropyl alcohols, toluene, dichloromethane, and water.

[c]Contents include ethyl, methyl, and isopropyl alcohols; acetone; trichloroethene; trichloroethane; dichloromethane; and toluene.

[d]Contents include isopropyl, diacetone, and ethyl alcohols; dichloromethane, and acetone.

[e]Contents include ethyl and isopropyl alcohols, dichloromethane, trichloroethane, and Freon.

[f]Contents include hydrochloric, sulfuric, nitric, and phosphoric acids.

[g]Contents include ethyl, methyl, isopropyl, and diacetone alcohols.

[h]Contents include ethyl and isopropyl alcohol and trichloroethane.

[i]Contents include sodium, potassium, and ammonium hydroxide.

[j]Contents include ethyl and isopropyl alcohols, acetone, toluene, Freon, trichloroethane, and trichloroethene.

[k]Contents include unspecified solvents; some may be halogenated.

MOCA - 4,4-Methylene-bis-(2-chloroanilene)

Three cooling tower basins are installed to collect the cooled water from the 10 cooling towers and recycle it back into the plant cooling system. The cooling tower basins are below-ground concrete sumps and are provided with circulating pumps. The basins are covered with a concrete top and are on the north side of the cooling towers. Periodically, blowdown of the cooling water system is performed. The blowdown water is routed to the Mound drainage ditch. The area around the cooling towers and the basins is covered with asphalt to keep dirt and debris from entering the tower via the air draft. The start-up dates for the cooling tower basins vary. They are all currently in operation.

A cooling tower drum storage area is located near the cooling towers. The storage area consists of an asphalt pad on the south and west sides of the cooling tower. The pad is used as a chemical staging area. No containment system is present to control drum leakage or runoff. The pad is used to stage biocides, anticorrosion chemicals, boiler treatment chemicals, ethylene glycol, and other powerhouse water treatment chemicals contained in 55-gallon drums. The pad was built in the early 1970s and is still operational.

3.5. *PHOTOPROCESSING*

Photoprocessing activities are conducted at approximately 20 locations at Mound. The functional groupings of these activities are listed below:

- Product Development and Environmental Testing
- Manuals and Procedures
- Drawing Control
- General Analytical
- Advanced Devices Plastics (ADP) Operations
- Photography
- Instrumental Analysis
- Radiography (Industrial)
- Radiography (Medical)
- Classified Explosives Work

Specific wastes generated from the above activities include approximately 2,850 L (750 gallons) of spent fixer solution that are collected and stored on-plant for future recovery of silver using a recently acquired electrolytic unit, and approximately 2,850 L (750 gallons) of other photoprocessing waste consisting of developers, stop baths, bleaches, rinses, etc., that are collected for on-plant storage prior to transfer to an EPA-permitted vendor for transport and treatment/disposal.

In addition, very small amounts of photoprocessing waste are generated by X-ray film development. The X-ray film development is performed in Building DS, using a Hope processor, which uses Kodak chemicals (Kodak Industrex developer and replenisher, Kodak Industrex fixer and replenisher, Kodak

liquid developer system cleaner, and Kodak fixer wash system cleaner). These chemicals are collected in a waste can for pickup by Mound waste management personnel. In 1989, 4 gallons of photoprocessing waste were collected by Mound waste management personnel. In February 1990, a new Fuji processor replaced the Hope model. Different chemicals are now used, and Mound waste management is developing a plan for waste disposal.

3.6. ANALYTICAL LABORATORIES

The analytical laboratories support the research, production, and waste treatment operations at Mound. They also periodically participate in weapons components surveillance programs and the Safeguards Analytical Laboratory Exchange (SALE) program. The purposes of the SALE program are to verify standard analytical techniques used by other laboratories and to verify the radioisotope inventory.

3.6.1. Wastes Generated

The volume of waste generated by the analytical laboratories is very small. Solid wastes have included glass, paper, and plastic contaminated with plutonium-239, plutonium-238, uranium-235, uranium-238, beryllium, and mercury. The beryllium-contaminated wastes included glass, paper, gloves, and sample precipitates. Typically, less than 0.1 g of beryllium has been generated annually.

3.7. ENVIRONMENTAL MONITORING PROGRAM

The environmental monitoring program at Mound began with the bioassay program in 1948, managed by the health physics group. The program was conducted from 1948 to 1955 in the I Building, which was constructed to provide a facility separated from the other research and production activities to provide the low radioactive backgrounds necessary for low-level counting. Similar work had been conducted in the warehouse in Dayton, which was removed from the other Dayton units. In 1955, the low-level counting facilities were moved from the I to the T buildings, and in 1967, they were moved to a new isolation laboratory in the E Building, where they remain.

The environmental program was conducted by the health physics group and included worker urinalysis, air samples, surface wipe samples, and river surveys. Monitoring of the polonium levels in worker urine samples and in the environment was the focus of the work in the 1940s and 1950s. As other radionuclides came into use at the plant, the scope of the environmental program expanded; radium-226 was added to the urinalysis program in 1950, plutonium-239 in 1956, and plutonium-238 and tritium in 1958. Thorium was added in 1955 as part of the ionium and anticipated thorium refinery program, but was shortly terminated (Meyer 1956a). Radium-226 and plutonium-239 were phased

QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

HOK/K

STAFF PERSONNEL
QUALIFICATIONS RESUME

JOHN W. EY, P.E.

MANAGER, ENVIRONMENTAL ASSESSMENTS

Education

Bachelor of Mechanical Engineering, Vanderbilt University (1979)

MBA - Finance, University of Cincinnati (1988)

Registration

Registered Professional Engineer, Ohio, 1989
Registered Professional Engineer, Louisiana, 1986
Registered Environmental Property Assessor (REPA), 1994
Certified Professional - Ohio EPA Voluntary Action Program (Brownfields), 1994

Qualifications

Mr. Ey is currently the Manager of Environmental Assessments. Mr. Ey has performed over one hundred environmental site assessments throughout Ohio and other midwest states. He has also performed regulatory compliance audits in several large industrial facilities throughout the U.S.

Mr. Ey's former assignment at HOK/K was in the area of underground storage tanks (USTs). His responsibilities included the evaluation of tank systems, oversight of tank integrity testing, removal of underground storage tank systems, testing of soils and groundwater, coordination of remedial action plans with state and regulatory officials and writing of closure plan documents. He has prepared reports in compliance with BUSTR, USEPA and OEPA regulations. After receiving his MBA in 1988, he managed a construction company specializing in installation of UST systems for various petroleum products retailers.

Mr. Ey is a Professional Engineer with seventeen years of experience in a variety of industrial settings. His broad experience began with a major oil company where he had assignments in both refining and production. He developed specific experience in engineering design, plant operations and regulatory liaison. In his regulatory position, he was responsible for commenting on proposed EPA and OSHA regulations, interpreting the promulgated rules, and implementing them for oil and gas operations over a six state area. He coordinated annual NPDES reporting to USEPA for over 100 offshore drilling locations.

Qualifications (cont'd)

In addition, he has a working knowledge of a wide range of environmental regulations associated with the CWA, CERCLA, RCRA, OSHA and SARA.

Relevant Experience

Environmental Site Assessments and Audits

Performed over 100 environmental site assessments throughout Ohio and the midwest. These assessments are used to establish the innocent landowner defense under CERCLA. Mr. Ey has a working relationship with various lending institutions and developers.

Participated in environmental compliance audits of several industrial facilities throughout the U.S. These audits are typically performed for the legal counsel of the potential purchaser of the properties.

Underground Storage Tanks

Provided project management expertise for removal of over 100 underground storage tanks in northwest and southwest Ohio. These closures were prepared in accordance with BUSTR, USEPA and OEPA regulations.

Managed a construction company specializing in installation of underground storage tank systems for various petroleum products retailers.

Regulatory Engineering

Served on oil industry associations and worked with various state and federal regulatory agencies to influence development of new regulations.

Developed company positions regarding proposed regulations and submitted comments to the various agencies.

Interpreted new regulations (USCG, OSHA, COE, EPA and agencies over a six state area) and developed compliance procedures for company use.

Coordinated annual environmental (NPDES) reporting to USEPA for over 100 offshore production and drilling platforms.

Drilling Engineering

Designed drilling plans for fifteen oil and gas wells varying in depth from 5,000 feet to over 15,000 feet in Southeastern United States. This work included selection of appropriate drilling techniques, design of casing and selection of casing points, and testing of productive wells.

Relevant Experience (cont'd)

Refinery Engineering

Monitored refinery energy performance and presented monthly reports to upper management. Developed annual energy use forecasts.

Provided engineering support for mechanical equipment and was responsible for product quality.

Provided engineering support for major unit renovations (turnarounds).

Employment History

1989 - Present	HOK/K INDUSTRIAL Miamisburg, Ohio Manager, Environmental Assessments
1988 - 1989	COURTESY PETROLEUM MAINTENANCE Beavercreek, Ohio Vice President
1979 - 1987	EXXON COMPANY, U.S.A. Baton Rouge and New Orleans, Louisiana Refinery Engineer and Drilling Engineer

HOK/K

STAFF PERSONNEL
QUALIFICATIONS RESUME

JENNIFER C. VICAREL

ENVIRONMENTAL SCIENTIST

Education

Bachelor of Arts, Geology and Spanish, Trinity University (1982); cum laude, Phi Beta Kappa, Who's Who Among American Colleges and Universities.

Junior Academic Year Abroad, Institute of European Studies, Madrid, Spain (1981-1982).

Master of Science, Geology, Ohio State University (1985). Thesis field area: Navidad, Chile.

Continuing Education: Aquatic Toxicology, Tulane University (1986); Hydrogeology, University of New Orleans (1987); Analysis and Design of Aquifer Pumping Tests, National Ground Water Association (1989); Risk Assessment for Soil Contamination, University of Milwaukee-Wisconsin (1992).

Certifications

OSHA 40-hour Hazardous Waste Site Worker Certification; 8-hour Refresher Certification current through 1994

OSHA 8-hour Hazardous Waste Site Supervisor Certification

Qualifications

Ms. Vicarel's qualifications include ten year's experience as an environmental geologist in the environmental industry. Most recently she has performed hydrogeologic and remedial investigations, baseline risk assessments, and environmental impact statements for Fortune 50 industrial clients. Ms. Vicarel has completed numerous environmental site assessments for real estate transactions. She has also participated in environmental investigations of a Mexican border (maquiladora) facility for a Fortune 50 property, for which she also served as translator and liaison with the Spanish-speaking staff.

Qualifications (cont'd)

Ms. Vicarel's duties have included preparation of project proposals, budgets, and schedules; organization and execution of field investigations for data collection and analysis; evaluation of data and assessment of exposure and toxicological effects for baseline risk assessments; performance of hydrogeologic evaluations of state-regulated hazardous waste sites targeted for remediation; supervision of peers and field staff; participation in preliminary design and implementation of remediation systems; and authorship of technical reports and regulatory file review reports.

Ms. Vicarel has also served as an Health & Safety Representative of her company. Responsibilities include preparation and approval of health and safety plans, implementation of medical monitoring program, maintenance of OSHA training requirements, compliance with OSHA recordkeeping requirements, and purchasing of personal protective and monitoring equipment.

Relevant Experience

Risk Assessments

Ms. Vicarel has performed risk assessments for both RCRA- and state Superfund-regulated sites in New York and Ohio. Contaminants of concern at these facilities have included a suite of chlorinated solvents, pesticides, and fuels.

Hydrogeologic and Remedial Investigations

Working on sites regulated by state-Superfund (CERCLA) and RCRA programs in Massachusetts, New York and Ohio, Ms. Vicarel has investigated industrial facilities including a shipyard, several large aeronautics manufacturing facilities, a vacuum products manufacturing plant, corporate headquarter facilities of two large photographic equipment producers, an automotive assembly plant, a nursery, and an electric and gas utility. Chemicals released to soil and/or groundwater at these sites include fuels (gasoline, diesel, fuel oil), PCBs, chlorinated solvents, pesticides, and semivolatile compounds (PAHs, creosote compounds).

Environmental Site Assessments

Ms. Vicarel has performed numerous environmental site assessments in Massachusetts (under Chapter 21E Law), New York, and Ohio prior to real estate transactions. The objective of these assessments is to establish innocent landowner defense under CERCLA. Clients for these projects have included developers, banks, lawyers, manufacturing facilities, and industrial companies.

Relevant Experience (cont'd)

Exploration Geologist

Working in the Frontier Province of the Eastern Gulf of Mexico, Ms. Vicarel identified and assessed exploration prospects using geological and geophysical data. She successfully presented several prospects to upper management thereby influencing corporate decisions regarding off-shore land acquisition.

Professional Affiliations

Association of Groundwater Scientists and Engineers, division of National Ground Water Association

American Association of Petroleum Geologists

Society of Environmental Geology (formerly Society of Economic Paleontology and Mineralogy

ELLEN E. STANIFER

PROJECT ENGINEER

Education

Bachelor of Science, Chemical Engineering, University of Cincinnati (1986)

Continuing Education in Health and Safety and Asbestos Abatement (1988-1989)

Registration

OSHA Hazardous Waste Site 40-hour Training
OSHA Hazardous Waste Site Supervisor 8-hour Training
American Red Cross First Aid
American Red Cross CPR Training

Qualifications

Ms. Stanifer is a Project Engineer. Her experience in the environmental field includes process air and water permitting, NPDES stormwater permit applications, preparation of Storm Water Pollution Prevention Plans and Storm Water Sampling Plans and SARA Title III compliance. She also has experience in conducting environmental site assessments and regulatory compliance audits. Ms. Stanifer has additional experience in emergency response to uncontrolled hazardous waste sites, remedial cleanup of hazardous waste sites, endangerment assessments, and environmental sampling. Her experience also includes work addressing health and safety issues including the use of personal protective equipment and certification for asbestos abatement.

Relevant Experience

<u>Environmental Experience</u>

Prepared Permit to Install and Permit to Operation Applications for air emissions sources.

Prepared Wastewater Pretreatment Permit to Install Applications for various industries in the Ohio region.

Prepared NPDES permit applications, including storm water discharge permit applications, for various industries in the Ohio region.

Relevant Experience (cont'd)

Prepared storm water permit applications, storm water pollution prevention plans and developed storm water sampling plans to satisfy NPDES storm water requirements.

Prepared SARA 312 and 313 reports and support documents.

Performed over 200 site assessments on undeveloped, commercial and industrial properties. In conjunction, performed numerous regulatory compliance audits on the industrial properties.

Managed a $3 million Superfund cleanup of polychlorinated biphenyls and asbestos from a 13 acre abandoned manufacturing facility.

Conducted endangerment assessments of hazardous waste sites including contaminants such as cyanide, organics, metals, and polychlorinated biphenyls.

Performed environmental sampling of soils, sediments, water, sludge, drums, underground and above ground storage tanks and solid wastes.

Investigated the use of alternative technologies for a wide variety of hazardous waste remediation.

Received Contractor/Supervisor Certification for Asbestos Abatement from the State of Ohio.
