

Comments to OU6 RFI/RI

L M Brooks *JMB*

- 1 M Section 8 0 The recommendation to the best management practice of retaining the ponds for protection of offsite surface water and continue to provide storm water quality improvement should be verified/coordinated with the pond management plan currently under development
- 2 G Section 6 4 4 Specifically, the exposure pathway for the ingestion of fish in Walnut Creek This is not a comment to change the text, but there may be a comment from the State on whether this pathway is really incomplete (The action levels/cleanup standards group has been arguing whether the streams need to be protective of human health and fish ingestion)
- 3 G Section 6 5 4 Are there any ground water impacts to surface water? Are there any seeps in the area?
- 4 G Section 6 11 A reference is made to the DOE standard of 100 mrem/year The action levels/cleanup standards group has been discussing the EPA proposed rad standard based on 15 mrem/year (in addition to the DOE standard) If there is no time to incorporate EPA's proposed rad standard, the may be a comment from the regulators
