SUBJECT: REPORT ON RADIOMETRIC SURVEY

The Radiometric Survey that was conducted during the time period 1977 to 1984 evolved from the use of FIDLER (Field Instrument for Detecting Low Energy Radiation) type instruments for research projects designed to identify methods to evaluate contamination in soil. Experimental instruments were being used at the Rocky Flats Plant as early as 1971 or 1972. A copy of a 1974 letter from DOE (attached) recognized that the FIDLER was becoming an important research instrument. Because the FIDLER was easy to use and was the best available technology at the time, a plant wide survey was undertaken in 1977 with the concurrence of DOE (see attached letter). The instruments used at the Rocky Flats Plant are composed of a NaI scintillation probe made by Bicron Corporation and an analyzer from Ludlum Measurements, Inc. (brochure attached).

Due to instrument and manpower limitations, the survey was conducted only when personnel were available and the weather cooperated. Construction activities took precedence in the survey so that the affected areas could be surveyed prior to excavation. Building 910, the reverse osmosis plant, is one good example of a project where the survey was done prior to ground breaking and radioactive soil contamination was found. Contaminated soil had to be removed before construction could proceed and the FIDLER was used to identify where the contamination existed and when removal was sufficient. This project was the first use of front-end loaders to place moist soil into wooden boxes for off-site shipment. Prior to this, contaminated soil removal had been done in a portable house with a HEPA filtered exhaust system. This type of excavation was very labor intensive. The soil was removed using shovels and hand water sprays to control resuspension, and the soil was placed into plastic bags.

The PSZ (Perimeter Security Zone) project represented one of the first large areas to be surveyed. In order to log the survey and to map the area, survey sites were measured into strips ten feet wide by 300 feet long. Wooden stakes were placed in the corners and yellow ropes were laid on the ground to delineate the strips. The Radiation Monitors wielding the FIDLER would slowly walk a zig zag path between the ropes. Readings were generally recorded by a salaried employee from HS&E. In later years the monitors did their own mapping and recording and reported the results weekly to Environmental Analysis and Control.

More careful monitoring was performed when an unusual reading was noted during the initial survey. Readings were recorded and the area marked, usually with wooden stakes with yellow and magenta barrier tape between them. EA&C and the Radiation Monitor supervisor were also notified. If the identified area was not in a construction area or in an area of potential risk to personnel or the environment, the survey continued. Arrangements for removal or clean up were made if the contamination was an immediate hazard or obstructed construction. However, cleanup was not intended to be an integral part of the survey.

In the early years of using the FIDLER, several attempts were made to correlate the counts per minute (c/m) readings on the instrument with a quantitative activity. This technique was discarded and the c/m readings were more properly used to indicate only relative differences in activity. "Hot Spots" which were found by the FIDLER could be anything from plutonium to depleted uranium. Specific radioisotopes could be identified only by laboratory analysis of a soil sample. (See letter Setlock to Greengard 08-19-88 which discusses the limitations of the FIDLER.)

By September, 1984, over 11,000,000 square feet of the Rocky Flats Plant had been scanned using FIDLER instruments. The survey accomplished it's purpose of locating abnormal radiation levels in the soil of the Rocky Flats Plant and confirmed that large areas of the plant have higher than environmentally acceptable levels of radioactive contamination. (See the letter of completion, Yoder to Nicks 09-18-84 and a map of the survey attached.)

FIDLER READINGS AT ROCKY FLATS

Subsequent to the HASL survey referenced in your letter to me dated December 20, 1973 under the above subject title, Dow conducted an independent survey of the soil southeast of the 903 area. The Dow survey included FIDLER counting on a grid and a limited number of soil samples at selected locations. The conclusion was that the Dow FIDLER data and specific plutonium soil sample data were in agreement with the HASL data even though the counting locations and soil sample sites were not the same.

As a result, it was decided to report the Dow data in the Annual Environmental Report for 1973. Reference will be made to the fact that HASL conducted a survey of the same site and that Dow's independent survey was in good agreement.

RADIOMETRIC SOIL SURVEY - PLAN

Please document and implement a plan which establishes quarterly survey commitments toward the ultimate completion of the radiometric soil survey, as agreed to at the November 8, 1977 meeting with ALO representatives. The plan should relate to a priority listing for completion of specific plant areas. We recognize that plant construction heavily impacts survey priorities (e.g., pre-operational survey of the area around Buildings 371/374), therefore annual review and revision may be appropriate.

Please provide a copy of the subject plan to RFAO by February 17, 1978. In addition to the information previously requested in monthly reports to the RFAO, please include once per quarter a statement reflecting progress in terms of the commitments set forth in this plan.

GENERAL DESCRIPTION
The Model G5 FIDLER Probe is a NaI (Tl) scintillation probe designed to combine a rugged field package with laboratory sensitivity.

Low background components are used to achieve optimum response for low level-low energy applications.

This probe was specifically conceived for use in "Broken-Arrow" Emergency Response Instrumentation Kits. When used with the Bicron analyst™ survey meter, the G5 becomes part of a versatile, sophisticated, portable detecting system.

The G5 is compatible with other survey meters designed for use with scintillation detectors.

Due to our capabilities in NaI (Tl) and organic scintillators, Bicron can offer a wide variety of scintillation probes. Versatile survey systems can thus be obtained, particularly when the probes are used with the Bicron analyst™ survey meter, or the lab-tech™ scaler/ratemeter/analyzer.

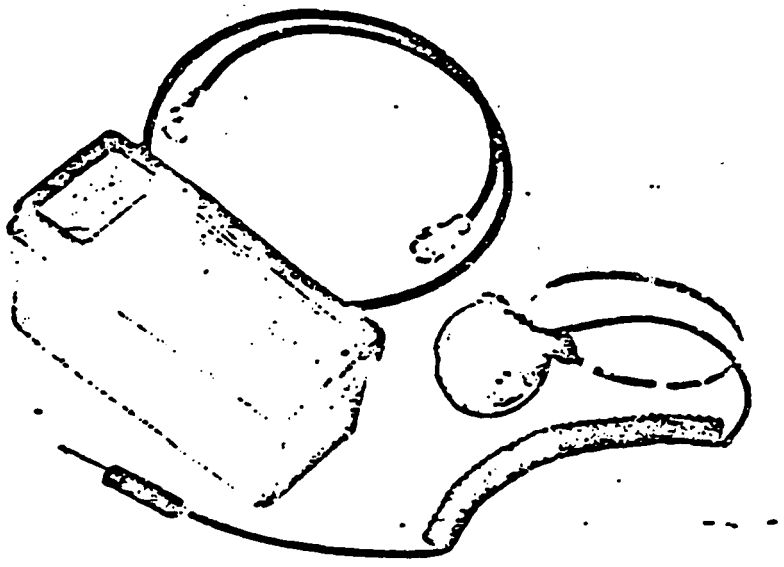
MODEL 16 | ANALYZER



GENERAL DESCRIPTION

The Model 16 Analyzer supplies the complete electronic requirements for scintillation, proportional or GM monitoring with the added feature of a window amplifier for selective gamma monitoring. A two-position switch marked "IN-OUT" allows the instrument to operate as a normal count rate meter or as a single channel analyzer. With the analyzer switch in the OUT position, the Lo discriminator controls the discrimination level and the Hi discriminator is inactive. In this mode, the instrument performs as a normal count rate meter. With the analyzer switch IN, the Lo discriminator acts as a threshold selector and the Hi discriminator selects the upper discrimination level. The upper discrimination level may be adjusted between the threshold level and two times the threshold level (not exceeding 60 millivolts). In this mode, the unit operates as a single channel analyzer.

SPECIFICATIONS

COUNT LINEARITY: ±5% of the full scale.

DISCRIMINATION RANGE: Low Discriminator 2 to 60 millivolts.

PULSE RATE METER, MODEL PRM-5 and MODEL PRM-5-3

GENERAL DESCRIPTION

The PRM-5 is a portable battery operated pulse rate meter with single channel pulse height analyzer capabilities. The instrument may be used with a wide variety of scintillation or proportional detectors to detect alpha, beta or gamma radiation. The advantage of the PRM-5 is the measurement of a low energy radiation in the presence of higher energy radiation of the same type. A panel mounted switch can disable the PHA, yielding a conventional gross counting instrument.

The count rate is read out by the Eberline LIN-LOG presentation. This presentation eliminates all scale switching and multiplying factors, yet retains linear increments within each decade. Four decades are covered using two meter movements to yield a scale length of about 1.5 inches per decade, which gives maximum readability and ease of interpretation.

Full scale readings for the four decades are 500, 5K, 50K and 500K counts per minute (CPM) respectively, calibrated to read the true pulse frequency. Other ranges are available.

The instrument electronics are packaged on three plug-in etched circuit boards for ease of maintenance and for maximum versatility.

The battery pack uses five standard "D" size cells of any type commercially available (carbon-zinc, mercury, nickel-cadmium, alkaline). This allows a choice depending on the battery feature considered most important. A battery condition check is provided on the front panel.

Aural monitoring capability is included by a connector on the front panel. Either a headset or an EIC Model SK-1 speaker may be used. This signal may also be used for pulse counting with an external scaler.

The PRM-5-3 is identical to the PRM-5 except it has three switch selected HV ADJUST controls. This allows presetting up to three different conditions, such as , three different energies with the same probe, or with different probes.

SPECIFICATIONS

RANGE OF OPERATION: 0 to 500,000 counts per minute in four linear, continuously progressive LIN-LOG decades; 0 to 500, 500 to 5,000, 0 to 50,000 and 50,000 to 500,000. Calibrated to pulses. (1 for 1)

OPERATIONAL CONTROLS: Three position front-panel mounted switch (OFF, ON, BATTERY CHECK), H.V. ADJUST.

INDICATORS: Visual-Scale Markings: 10 divisions per decade with numbers at 1/2 and full decades. Scale Length: nominal 6.32 in. (1.74 in. 1st and 3rd decades, 1.42 in. 2nd and 4th decades). SUBJECT· REQUEST FOR DETAILED REPORT ON RADIOMETRIC SURVEY

In your letter of 8/16/88 (see attached) you stated that A. E. Whiteman (Area Manager, DOE/RFAO) recently expressed surprise that all areas identified in the HS&E Radiometric Survey had not been cleaned up. In fact, all areas identified as "above background" by the radiometric survey were indeed remediated. These areas were primarily adjacent to the 903 Pad Area and Buildings 776/777 (1969 Fire Incident). The important factors here are the purpose of the survey, the type of instrumentation used and its inherent sensitivity to plutonium in soil. Please recall that the radiometric survey (1977-1984 timeframe) was conducted by field personnel using FIDLERs (Field Instrument for Detection of Low Energy Radiation). Checking with radiation instrumentation staff, it will become evident that this instrument is only capable of detecting very high levels of plutonium in the uppermost surficial layer of soil (i.e., top 0.5 cm). For example, making optimum assumptions on detector geometry, energy speciation, response time, signal attenuation, etc., one can calculate that surficial plutonium concentrations ranging from 10,000-60,000 pCi/gram will not be detected above the response threshold (2X background) of a FIDLER instrument. These assumptions are very conservative and the corresponding detection limits for plutonium in soil can be even higher depending on other variables such as screening techniques, detector height above soil, soil/grass/moisture attenuation, etc...

The purpose of the radiometric survey was to detect extremely contaminated areas of the plantsite (500,000-1,000,000+ pCi/g) for worker safety and environmental containment purposes. Therefore, "hot spots" in the Radiometric Survey were operationally defined as levels which exceeded "background FIDLER measurements" and triggered an instrument response. Consequently, the "hot spots" currently under discussion (i.e., radioactively contaminated soil areas identified in 881 Hillside Remedial Investigation Report) are obviously not "hot spots" in the operationally defined sense of the Radiometric Survey conducted in 1977-1984. Clearly, the focus of the Radiometric Survey effort was to identify and remediate substantially higher levels of plutonium in soil than must be addressed by your 881 Hillside Feasibility Study.

Your 8/16/88 information request specifies that the following areas of the radiometric survey be addressed in a detailed technical report:

1) Survey design
2) Equipment used
3) Areas surveyed
4) Survey results
5) Areas cleaned up
6) Clean up methodology
7) Waste disposal sites & documentation

Our HS&E report can address areas (1)-(4) comprehensively; areas (5)-(7) will only be addressed superficially but they can be addressed in greater detail by your Waste Operations group who handled the cleanup/disposal activities.

We will make every effort to meet your September 1, 1988 deadline for this report. Please contact me if you have any questions or require additional information prior to our September 1, 1988 deliverable to you.

RADIOMETRIC SOIL SURVEY COMPLETION

The Radiometric Soil Survey of the Rocky Flats Plant site has been completed approximately three years ahead of schedule. In November, 1977 when Rockwell International originally agreed to undertake this task it was anticipated that this project would require ten years to accomplish.

Using the FIDLER (Field Instrument for Detecting Low Energy Radiation) survey instrument, Rockwell personnel have methodically scanned over 11,000,000 square feet of the Rocky Flats Plant. Over 2,000,000 square feet were devoted to the Perimeter Security Zone (PSZ) which was originally designed to extend outside the existing perimeter chain-link fence. All of the contaminated soils identified were removed where practicable and above background areas of the plant were documented by this radiometric survey.

RADIOMETRIC SOIL SURVEY COMPLETION

The Radiometric Soil Survey of the Rocky Flats Plant site has been completed approximately three years ahead of schedule. In November, 1977 when Rockwell International originally agreed to undertake this task it was anticipated that this project would require ten years to accomplish.

Using the FIDLER (Field Instrument for Detecting Low Energy Radiation) survey instrument, Rockwell personnel have methodically scanned over 11,000,000 square feet of the Rocky Flats Plant. Over 2,000,000 square feet were devoted to the Perimeter Security Zone (PSZ) which was originally designed to extend outside the existing perimeter chain-link fence. All of the contaminated soils identified were removed where practicable and above background areas of the plant were documented by this radiometric survey.

SUBJECT·RADIOMETRIC SURVEY

For week ending 5/15/84 Radiation Monitoring surveyed 120,900 sq. ft. Of the 120,900 sq ft 90,900 sq ft was surveyed around Building 444 Area C. We were unable to survey 750 sq ft due to high background. This area is located north of Building 447 and west of Building 448. Also 4 sq ft was found above background located 7 ft south of Door 25 Building 444, 32 ft west of Building 444 and 10 ft north of Building 453 (see attached map for details). Of the 120,900 sq ft 30,000 sq ft was surveyed in the north east corner of Area B. No problems found (see attached map for details).

Hazard Mitigation

Activity Number

Mechanical Hazards

_____ - Do not stand near backhoe buckets and earth moving equipment.
_____ - Verify that all equipment is in good condition.
_____ - Do not stand or walk under elevated loads or ladders.
_____ - Do not stand near unguarded excavation and trenches.
_____ - Do not enter excavation or trenches over 5 feet deep that are not properly guarded, shored or sloped.
_____ - Consult DHSO if other mechanical hazards exist.

Electrical Hazards

_____ - Locate and mark buried utilities before drilling.
_____ - Maintain at least 10-foot clearance from overhead power lines.
_____ - Contact utility company for minimum clearance from high-voltage power lines.
_____ - If unavoidable close to buried or overhead power lines, have power turned off with circuit breaker locked and tagged.
_____ - Properly ground all electrical equipment.
_____ - If equipment must be connected by splicing wires, make sure all connections are properly taped.
_____ - Be familiar with specific operating instructions for each piece of equipment.

Chemical Hazards

_____ - Use personal protective equipment indicated on page 8.
_____ - Conduct direct reading air monitoring to evaluate respiratory and explosion hazards (list instrument, action level, monitoring location, and action to be taken on page 11).
_____ - Consult DHSO for personal air monitoring.

Temperature Hazards

Heat Stress:

_____ - When temperature exceeds 70°F, take frequent breaks in shaded areas. Unzip or remove coveralls during breaks. Have cool water or electrolyte replenishment solution available. Drink small amounts frequently to avoid dehydration. Count the pulse rate for 30 seconds as early as possible in the rest period. If the pulse rate exceeds 110 beats per minute at the beginning of the rest period, shorten the work cycle by one-third.

Cold Stress:

_____ - Wear multi-layer cold weather outfits. The outer layer should be of wind resistant fabric.
_____ - O to -30°F total work time is 4 hours. Alternate 1 hour in and 1 hour out of the low-temperature area. Below -30°F, consult industrial hygienist.
_____ - Drink warm fluid. Provide warm shelter for resting. Use buddy system. Avoid heavy sweating.

Acoustical Hazards

_____ - Use earplugs or earmuffs when noise level prevents conversation in normal voice at distance of three feet.

Biohazards

_____ - Poison oak, poison ivy.
_____ - Infection waste.
_____ - Rabid animals, poisonous reptiles. Wear heavy gloves and coveralls when working with animals. Approach trapped animals with caution.
_____ - Ticks, mosquitoes, and other insects (disease carriers or poisonous).
_____ - Biological or animal laboratories.

Action: Field personnel will be taught to recognize poison oak and poison ivy. Insect repellents will be used as necessary.

Medical Surveillance Requirements

A baseline comprehensive physical examination must be on file with the RFP OHD for all employees working in the field. In addition, employees must have a follow-up medical exam at least once a year for as long as they work at the site. Upon reassignment to an area not associated with hazardous waste site work or who terminates employment must have a final exit medical exam.

Occupational Health Division Responsibilities:

- Treatment of illness and injuries in or arising out of the source of work
- Assistance in the documentation and investigation of work-related illness or injury
- Providing medical opinions about the ability of employees to perform the assigned work.
- Advice on medical treatment and transportation
- The maintenance and operation of a radiological and chemical decontamination facility at RFP.
- Providing medical surveillance programs for workers who are properly identified by a qualified IH as exposed, or at risk to become exposed, over action limits to specific toxic substances.

Project Manager Responsibilities:

Provide prior to commencement of work:

- Substances to which the employee is likely to be exposed, expected frequency, and duration of exposure.
- Time, place, and extent of previous exposure to these substances above TLV.
- Type of PPE to be used by the employee, when, and what training has been given about its use.
- The estimated number of days per month the worker is to use PPE, especially respirators, in the coming year.
- The estimated length of time the employee is expected to continue as a HAZMAT worker.

Employees Responsibilities:

- Recognizing the detectable signs or symptoms of overexposure to chemical or physical hazards.
- Advising their supervisors of any physical or mental conditions that could affect work performance.
- Reporting all occupational injuries or illnesses immediately.
- Reporting to the Occupational Health Department to have limitations verified or restrictions imposed (restrictions recommended by an off-site physician must be presented in writing to the Occupational Health Department).
- Reporting to the Occupational Health Department for re-evaluation as scheduled.

Subcontractors Responsibilities:

- Responsible for providing and implementing a medical surveillance program for all employees assigned to work in the field that meet the requirements of 29 CFR 1910.120(f)(2).
- Subcontractor physician must provide written authorization that each employee working at the site is fit to work.
- Subcontractor physician must provide authorization that the employee is medically qualified to wear a respirator.
- Receive respirator fit through EG&G Industrial Hygiene Department.
